In a DP Operation

# THE SUN NEVER SETS ON ADR SOFTWARE

Day and night ADR software products are an integral part of over 4,000 installations worldwide. ADR's family of related management and programmer aids cuts DP costs at every phase of system life. They are talent amplifiers which simplify life for managers, analysts, and programmers.

When a system is in the design phase, before source code exists, AUTOFLOW II will generate system charts, design specifications, and logical flow charts. And ADR's System Analysis Machine (SAM) will yield accurate forecasts of the impact of a new application on site resources.

If Structured Programming is adopted, MetaCOBOL provides the essential link between the special SP verbs and compilable COBOL — making the program self-documenting and properly structured right from the beginning of the design phase.

During implementation, The LIBRARIAN stores, manages, and controls access to source programs as they are written. MetaCOBOL reduces programmer effort by means of its flexible facilities for coding and testing.

ROSCOE, ADR's time-sharing executive, enables conversational programming and debugging at the terminal — greatly reducing programmer man-hours.

During verification, operational support, and enhancement, AUTOFLOW II helps programmers make revisions by identifying all statement label and data references, pinpointing data-structure inconsistencies and doing other cross-program auditing, and automating

much of the detailed labor of updating system documentation. During these phases, MetaCOBOL relieves the programmer of repetitive coding and enforcement of site standards. The LIBRARIAN maintains the source program library and controls access to it.

When the time comes to convert production programs — for example, to work with a data-base manager or to adapt to new hardware — SAM, AUTOFLOW II, The LIBRARIAN and MetaCOBOL continue their usefulness in forecasting the impact of the changed programs and systems, and then in converting and redocumenting them.

Each ADR product is a complete package — not just a program. It includes full documentation and on-site support.

No matter where you are in the world, there is an ADR-trained representative to help you install your product, train you in its use, and ensure its continued usefulness.

ADR is the only software company with more than 40 branch offices and representatives in 26 countries — each staffed with ADR-trained technicians. One of the oldest independent software houses still in existence, 16-year-old ADR has 4,000 installed products in place. With its support of active user groups, and its program of continuous maintenance and enhancements, ADR assures customers of thoroughly tested, reliable software of constantly increasing power and effectiveness.

Write for information on how ADR products can contribute to the effectiveness of your installation or contact any ADR office.

# 'No Bid' VA System Ruffles Congressional Feathers

By Nancy French  
OF THE CW STAFF

WASHINGTON. D.C.—A new \$50 million government computer project has come under criticism from Capitol Hill on grounds that it poses dangers to citizens' privacy.

Congressional critics, led by Rep. John E. Moss (D-Calif.), denounced the plan for still other reasons—the Target system was being developed without bids or appropriation from the Congress and, more importantly, "in violation of federal regulations that require competitive bidding" for such government expenditures.

The Target system has been proposed by the Veterans Administration (VA) as a means of improving that agency's handling of the nearly 16 million inquiries and claims received annually from the nation's veterans.

Already under way in Philadelphia is a \$600,000 pilot project, initiated by the VA without competitive bidding, according to congressional sources.

Moss has asked President Ford, who still heads the Domestic Council Committee on the Right of Privacy, to investigate the scheme which, he charges, "could threaten the privacy rights of millions of U.S. veterans."

#### Manager Had Reservations

As a result of Moss' concern over the Target project, Ralph E. Smith, general manager of the Target system for the VA, was asked to appear before a group of House Appropriations Committee staff members to explain what the new Target system is all about.

Smith told the committee that the system would establish 2,300 remote computer terminals in 59 VA field offices across the nation and would link them to large computer sites in such facilities as the St. Louis Records Processing Center, which has about 20 million national records on file.

According to Smith, the agency intends to issue contract proposals in January 1975 and have the Target system in operation by December 1976.

Smith told the committee that he had reservations about a controversial decision to select IBM as the \$600,000 pilot project contractor without any bidding for the job—a project that could lead to millions of dollars worth of future Target system contracts.

"There should be no sole-source procurement in government anywhere," Smith said. "It's not healthy."

## County Shelves On-Line Registration Program

(Continued from Page 1)

had some problems last fall that led to the exit of the previous director" but said the payroll errors to which Lambert referred haven't occurred since then.

The county will resume work on the on-line voter registration system after the election, he said, and eventually will put the system into use.

#### Postponed Implementation

Work on the project began last fall, with the goal of having the system fully implemented by the election time when voter registration began peaking.

In June, the system was "fairly" shape technically but the task of training operators remained, Griffin said.

Since it is his belief that "on-line systems work only as well as the people setting them terminals know how to use them," the county decided to postpone implementation until after the big fall election, he explained.

In the meantime, the county can continue to rely on its batch voter registration system, he said.

Pat Wilson, the former county recorder who is now a candidate for secretary of state, originally proposed the system (He also approved the Wilson specifications, Griffin noted).

Smith said further that, when the Target system is ready to operate, "nobody will give you security guarantees" that the system won't be used for purposes such as gathering personal information on veterans.

It was fear of data exchange among federal agencies that led Congress to kill the Fednet project earlier this year, and some critics say the VA is trying to break

the plan through the back door the same way the General Services Administration (GSA) killed Fednet (CW 7/21).

Moss has asked President Ford "to institute an immediate probe of the Target system followed by intensive scrutiny of what other agencies plan in this sensitive area."

In addition to correspondence with President Ford, Moss has requested justi-

fication for Target from directors of the Office of Management and Budget (OMB) and the GSA and the VA.

The OMB, under the Nixon Administration, approved the outlay for the Philadelphia pilot project and the GSA, under whose authority federal agencies purchase equipment and supplies, approved the purchase of gear for the pilot project without competitive bidding.

## Senate Committee to Approve Privacy Measure

(Continued from Page 1)

panel information systems containing personal information would have to prepare a report on potential security risks, the software and hardware security measures in the proposed system and consult with the National Bureau of Standards for guidance on security.

These reports would be submitted to a privacy commission, and agencies would be required to submit a report on how each system for at least 60 days after submission of the reports so they could be reviewed and heard could be held.

#### Correction Procedures

The bill would create a elaborate procedure for dealing with contaminated information. Agencies would be required to investigate any complaints that the information was incorrect and delete any information which was wrong or could no longer be verified.

If there was a dispute over the information, the agency in effect of the file would be allowed to add a reasonably long explanation to the record to present side of the dispute.

If the dispute was not resolved, the data subject would also have the right to a hearing in the agency within 30 days of filing a complaint and could then take the case to court if still unsatisfied with the response.

In addition, any agency would have to take all reasonable steps to notify the subject of a record before any information in that record was turned over to others.

The bill provides for exemptions for data banks in the area of national defense or foreign policy and for law enforcement intelligence files even though criminal history information would fall under the act.

However, any data bank operator that wished to have its system exempt from the statute would have to notify the public that it was seeking such exemp-

tion, explain what type of information was in the system and hold public hearings on the exemption.

Such exemptions would be subject to judicial review on a complaint of the file, not just on data subjects of the file.

Up until this point the House and Senate bills are extremely close in their underlying philosophy and wording, but they part company on the establishment of a privacy commission.

The Senate bill calls for a five-member commission made up of individuals not presently serving in the government and appointed by the President with the advice and consent of the Senate. However, a move on the part of Rep. Bella Abzug (D-N.Y.) to add such a provision to the Senate bill was beaten back in committee last week.

Under the Senate plan, the commission would be mainly a study group but would

also serve to interpret any of the rules laid down by the act in areas of dispute.

One of the primary purposes of the commission would be to study the need for laws in the area of privacy data banks and it would be required to report back in three years or sooner outlining regulations for this area.

One of the novel features of the Senate act is a provision to prohibit government agencies or others (including those in the private sector) from using data banks to process personal information as a condition for employment or for any other service, except where specifically approved by law.

However, the Senate committee struck a provision from the bill that would have prohibited the use of the Social Security Number for any purpose—public and private—unless required by law.

The senators reportedly felt they did not have enough information to determine the overall implications and cost of such a measure at present.

However, the report said it is being written to encourage the bill will express deep concern over the proliferating use of the Social Security Number as an identifier and will indicate that the matter should be studied closely with the eye to developing another law in this area.

## AT&T Seeks Dataspeed 40 Okay For Interstate Private-Line Users

(Continued from Page 1)

for installation with a monthly rental of \$125.

Optional features listed under the proposed tariff include:

- Extended storage: 48 lines, 80 characters per line at \$10/mo; 72 lines, 80 characters per \$20/mo.

- Additional editing capacity including protected format, substitute character, message preparation alarm, horizontal tabulation and highlighting for sets equipped with these storage capabilities: \$16-24/mo depending on storage capacity.

- 1,000-character storage for receive-only printer: \$60/mo.

- Message waiting, alarm and parity

check on roll call: \$5/mo.

When more than one Dataspeed 40 terminal operates on the same private line, the selective calling station arrangement will allow messages to be sent to any one of the individual stations.

In this arrangement the use of the communications line is controlled by the customer-provided line controller, according to AT&T. Dataspeed 40 printers can also be arranged on a broadcast network in that all terminals sharing the same line can receive the same message simultaneously, Bell added.

Dataspeed 40 terminals operate at 1,050- and 1,200 bit/sec compared with a Model 35 ASR Teletype speed of 150 bit/sec.

## 2-State Data Bank on Disabled May Save Government \$1 Million

By Edith Holmes  
Of the CW Staff

PHOENIX — Plans to computerize information on disabled persons in Arizona and California could save the Federal Government some \$1 million, according to state officials here.

Designed "to expedite and control the orderly flow of an application until a person can be approved for benefit payments," the creation of a data bank on the two states' disabled would reduce clerical overhead and the number of advance payments required when claims are not processed quickly enough, commented Dan Dantine, chief of the DP Division of the State Department of Administration.

"We may also be able to develop more efficient standards for examining people with claims," he added.

Finally, the federal Social Security office should save money by contracting work to a single computer headquarters serving two states, he said.

Initial requests by California to solve problems caused by the sheer volume and difficulties of its claims of this type, the system represents an agreement between the Social Security Administration and the states of California and Arizona and could serve as a model for other states.

Dantine, a Tucsonan, is slated to develop the program because "California has its hands full with other computer projects right now," and because the southwestern state has the computer capacity to do the job.

He contended disability benefits can take up to three times as much time as Social Security payments because the amounts paid out depend on a greater variety of conditions.

"Under Title 2 of the act providing for disability benefits, we must determine whether a worker has been disabled to the point of being unable to return to his/her normal profession, and Title 16 requires that the degree of disability determine the size of the payments," he said.

"When an applicant fills out an application, the case must go to one of the state's disability determination units before it can be processed," Dantine explained.

Mandatory considerations aside, he said the key motivation behind the project "is to get payment out to the people who need them as quickly as possible."

Once the data bank is established, workers in each disability determination unit in the two states will be able to call up and make additions to a file through a terminal system.

Dantine expects to have Arizona's files, compiled on dual Honeywell 6060s, up and accessible by July 1, 1975. California's records should be converted to the system by the end of that year.

When operational, the system will handle some 60,000 Arizona records and over 350,000 files for California each year.

Because the system will contain so many records of disabled persons, in addition to information on the doctors and other personnel who participate in the

### Computer Files Take Over Bookkeeping on Beekeeping

GUELPH, Canada — Since 1969, the University of Guelph has spent about \$100,000 computerizing data on beekeeping or apiculture, professional beekeepers were told at a meeting here recently.

Within two years, the school expects to have almost all available information on bees and beekeeping stored on computer tapes, a university spokesman said.

It will include data dating back to the 1400s, he added.

administration of their claims, "we've had to be concerned about individual privacy rights," Dantine remarked.

"We need to decide how to make sure that people's privacy is not affected. I think that the connection should be between our system and related programs and how we can keep records from two states separate within one system," he said.

"We're trying to provide as many hardware and software safeguards as possible," he said, noting his department has contracted its vendor, Honeywell, for suggestions.

He added that Arizona is working to gain access to some of the safeguards used in the Worldwide Command Control System, a network of computers owned by the Defense Department, and the world with a level of security and control greater than that normally found in operating systems.

## Tornado Wilts Grocery Service

LOUISVILLE, Ky. — Computerized shopping, like vacation plans and sporting events, is subject to the vagaries of nature — both human and Mother.

Call-a-Mart, the computerized food mart chain that is operating in this area a little over a year ago [CW, June 20, 1973], has learned that people use the service more or less depending on the weather, sickness at home and buying patterns.

A tornado which hit this city last April made a great impact on business here, because the entire east end of Louisville, the area in which the service originated and in which 30% of the families are Call-a-Mart members, lost its power and phone lines.

"And if a member doesn't have a power or phone line, it's pretty hard to buy from us," said Mark Weiss, Call-a-Mart's president.

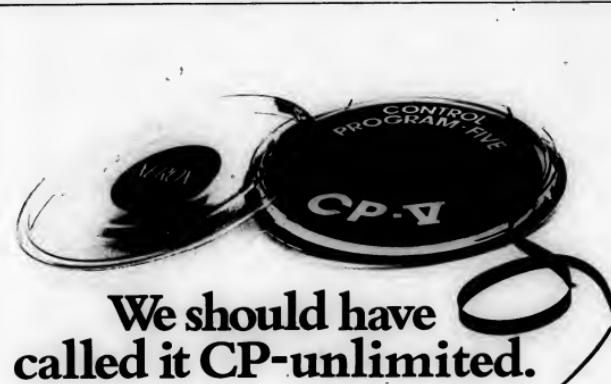

"[The tornado] changed a lot of

people's habits and buying patterns," he commented, "and a lot of people got food stamps [which Call-a-Mart does not accept] or were out of their homes for a long period of time."

Call-a-Mart's sales volume had an effect on our volume of business."

But Weiss denied newspaper reports that the business might have to close. He admitted the firm had sent out a letter to its members saying "we need your help and support and we need you to remain with us regardless, or we will be forced out of business."

"It was a way to get some additional sales through the summer months when our volume was light," he said. To use the system, the 20,000 members phone in their orders after selecting items from a catalog. Operates the orders and a computer tabulates the total cost, processes the order through the warehouse and prepares delivery truck routes.

## We should have called it CP-unlimited.

After all, it is the most advanced operating system around. And it's already been proven. And tested. (As any of our customers will tell you.) Plus, CP-V does give you simultaneous access in five modes: Real Time. Time-sharing. Multi-programmed Batch. Remote Batch. Transaction Processing.

There is the additional fact that Control Program Five (CP-V) ties together Xerox Distributed Multi-use computer systems.

And that CP-V is a key reason why our approach to hardware and software really works. (We've combined a unique hardware interrupt structure with independent processors and multi-port memory.)

All of which means you can talk to your computer and have it talk back to you intelligently. When you want to.

Not to mention that linking up CP-V to your present computer system presents minimal conversion problems.

It means more computer accessibility for more people in your company. Which means a smarter company. Which could mean a more profitable company.

And you can find out about CP-V for your company by calling (800) 421-6882. In California, (213) 679-4511, ext. 950. Or drop us a line at Xerox Corporation, Dept. 15-08, 701 S. Aviation Blvd., El Segundo, California 90245.

So why'd we merely call it CP-V instead of CP-Unlimited? Modesty.

## Motorized Mini Driven to Scene Of Accidents to Define Causes

By Nancy French

Of the CW Staff

**BUFFALO, N.Y.** — A computerized system designed to help save lives by defining the causes of highway accidents has been developed by Calspan Corp. here.

Housed in a Dodge Maxivan, the system consists of a CRT terminal, a minicomputer and other electronic gear linked via radio-telephone to a large computer at another location.

When an accident occurs, the van is driven to the scene, where investigators quickly gather pertinent data such as the type of accident, descriptions of vehicles involved and damage done to them, the presence of alcohol and tire tracks and notes on obstacles, debris and the terrain of the accident site.

Testimony from drivers and witnesses is also gathered, and all data is keyed into a Tektronix 4010 graphic display terminal. The data is then sent via radio-telephone to a large computer in a Texas Instruments Model 960A minicomputer with 24K memory until ready for transmission to the central computer via radio-telephone.

The central computer handles the investigation as a batch job, using a program known as the Simulation Model of Automobile Collisions (SMAC).

### Spots Inconsistencies

The computer ranks the importance and reliability of various items of evidence and helps the investigators in the field when it has sufficient information to reconstruct the mishap.

If there are inconsistencies in any measurements made at the scene or in testimony from drivers or witnesses, the system requires a report to the law enforcement agency of the findings, according to Raymond McHenry of Calspan's transportation safety department.

It also provides a statement on the contributing factors and principal cause of the accident and can even indicate possible violations of the law.

At any time during the investigation, the minicomputer in the field van can provide an "instant sketch" of the reconstructed accident up to that point — either via the CRT or in print.

According to McHenry, the computerized accident information can be used to:

- Evaluate the safety of various makes of cars and the merits of existing safety devices.

- Determine causes of accidents and injury and the role of the driver, the car or the highway in a given accident.

- Obtain important information on human tolerances to injury to aid the design of new safety devices.

Although the Calspan system for mathematical reconstruction of accidents is highly sophisticated, it has been electronically automated for operation by police with a minimum of additional training.

The design and testing of the prototype unit cost \$100,000, and four contracts totaling \$500,000 have been made with the National Highway Traffic Safety Administration of the U.S. Department of Transportation.

The system is now ready for field testing by several police departments in the Buffalo area.

Sale price of the equipment in various

An operator in the Calspan van gathers evidence through a transit at the scene of a highway accident for computerized reconstruction of the accident. The van is equipped with hydraulic levers to measure accurate measurement.

configurations, both with and without the van, is expected to be in the \$60,000 to \$80,000 range.

The SMAC program is available through the National Highways Traffic Association for approximately \$200.

## Guards Against Fire, Theft

## Firm Finds Employees Only Bug in Security System

**ELMSFORD, N.Y.** — An extensive electronic security system installed by Mathematical Applications Group, Inc. (Mag) over two years ago has been successful in protecting the computer applications company against large-scale losses that could result from a break-in.

"We've had no technical problem with the system," a Mag spokeswoman said. She added, however, that some company employees "occasionally forget just how exact the system is" and omit the procedure which prevents activation of the alarm system.

Installed and maintained by ADT Electronic Systems, the combination of warning and protection devices guards computer equipment in a 12,000-sq-ft facility. The system has an alarm rate of 360/65 in addition to a smaller computer used exclusively for visual simulation in the creation of computer movies.

Mag, whose business includes computer programming and direct mailing systems in addition to computer movies, purchased the security system also to protect

a vault of customer tapes and information from internal theft, according to the representative. She suggested this is the primary reason why security at Mag is so elaborate.

### Ultrasonic Sensors

A space protection approach in the form of an ultrasonic sensor mounted above the tape storage racks is used in the vault, the spokeswoman said.

To prevent intrusion by persons outside the company, the security firm installed a standard central station interconnected with a regular alarm system of the conventional and industrial type. The system includes perimeter protection devices, such as magnetic contacts which indicate when and where doors and windows are opened while the alarm sounds, and additional space protection.

To detect and combat fire in its initial stages, ADT mounted smoke detectors at intervals on ceilings throughout the Mag facility. If employees are present at the time of an emergency, and if the fire

seems strong enough to be brought easily under control, they can deactivate the alarm within 45 seconds.

If no one is present when the fire develops, or if the blaze is out of control, automatic control systems will shut down all ventilation or air conditioning equipment, extinguish any electrical fire or sparks and initiate a flow of Halon 1301 fire extinguishing gas through port openings in the ceiling, the spokeswoman explained.

If there are problems in the fire extinguishing system, the alarm system will transmit a coded signal indicating a fire alert at the computer installation to an ADT central station, and supervisors there will call the local fire department.

"We didn't want an alarm system that would be difficult to live with," Dr. Stephen S. McLean, Mag's president, commented when the system was installed in April, 1972.

To allow authorized personnel to come and go with maximum convenience, a small panel with pushbuttons was installed, permitting employees to deactivate the burglar alarm system when they enter and leave the building.

An employee has 30 seconds once inside the main door to enter the correct four-digit code for deactivating the alarm.

When problems do occur, the system will occur when people leave the building neglect to enter the code disconnecting the system, and the alarm goes off after they've left," the representative remarked.

Some codes are changed whenever an employee leaves Mag. "While some may consider it a nuisance to memorize new codes, the whole process involves much less bother and cost than a system of keys would," he concluded.

## Two Wrongs Make a 'Theft'

**DES MOINES, IOWA** — A data entry error in the conversion from manual to an on-line motor vehicle registration program led to a predictable result here recently.

Clyde Zenor Jr., 18, came home from work one day and found his car wasn't where he left it.

"The next day the police told him they had impounded it, and they kept saying he had stolen the plates," Zenor's mother reported.

The problem didn't clear up until Zenor's mom took his old registration and were taken to the courthouse for verification at the treasurer's office.

The county then discovered that it had two identical vehicle numbers in its regis-

tration data base, County Treasurer Fred Horner said. The police required into the data base, the new car brought up a description of the other car first.

And this is why Zenor appeared to have stolen plates on his car, Horner explained.

Zenor submitted a written statement to the Polk County Board of Supervisors explaining the mixup. Convinced, the board voted to reimburse him for the \$7.50 towing charge, the \$6 storage fee and the 40 cents in the car he had to pay to get it back from the police.

"It's only the first car like that we've had, although we've converted thousands of registrations to the computer," Horner said.

By Nancy French

Of the CW Staff

**ALBANY, N.Y.** — Popular science fiction author Isaac Asimov, who says he is "bearish about our survival," told an overflow crowd here recently that without help from the computer, survival is probably mankind's "last, least likely alternative."

Asimov said maintaining enough food and energy for a constantly growing world population is the chief problem facing mankind.

The solution, according to Asimov is "greater use of available tools such as the computer."

"Our technological society was not forced on mankind," he explained. "It grew out of the demand of human beings for plenty of food, warmth in winter, coolness in summer, less work and more play."

"Unfortunately, people want all of this plus all the children they like having, and the result is that technology in its command and performance has brought us to a situation of considerable danger," Asimov said.

### The Numbers Game

The solution is more computerization, not less, Asimov said.

Declaring that the name of the game is "Number with a capital N," Asimov illustrated his point with examples — Zip codes (because "we've overloaded the

## DPers Laud Lessons Learned at Standards Seminar

By Edith Holmes  
Of the CW Staff

NEWTON, Mass. — Attendees of a Brandon Applied Systems, Inc. seminar generally approved of the course's emphasis on standards and estimating in developing standards for project management and control, a recent *Computerworld* survey found.

More than half of those interviewed, who had attended the "Data Processing Standards" course offered four different times in four cities in November and December 1973, said they had learned from suggestions made in "resource estimating, skill identification and scheduling."

"I discovered estimating and preliminary planning for a project receive more emphasis today than they used to," remarked Larry Flynn, a project supervisor at the New York State Electric & Gas Corp.

Course hints in resource utilization "provide a practical approach I plan to try," said Henry V. Charnell, system requirements manager for Boeing Computer Services.

In keeping with Brandon's philosophy of applying the "how-to's" of developing good standards to a broad area like project control, many participants commented they took the course to learn techniques for developing standards in their particular projects.

Others said they attended to evaluate the course for use within their companies, and still others claimed they participated to learn various methods of handling project control difficulties.

Many said they felt the course would be of maximum benefit to those unfamiliar with project management and control. They agreed the seminar would help "those just entering the field" or "first-level management in the single-project level."

"This course is for the beginner," said Flynn. "If I had had 30 years ago, I would have gotten much more out of it."

But the survey found that most felt they came away with "a couple of good ideas."

John Armstrong, manager for the program management office at Sperry Univac, said he developed an appreciation for the need "to define milestones in a project so they are measurable."

Project control assistant for the Chemical Abstracts Service at Ohio State Uni-

### School Days

Sept. 30-Oct. 1 — DP Career Structures and Development; New York\*, \$275; Brandon Applied Systems, 1611 N. Kent St., Arlington, Va. 22209.

Sept. 30-Oct. 1 — Data Communications: The Executive Imperative; San Diego\*, \$350; Computerworld EDI Seminars (CW), 797 Washington St., Newton, Mass. 02160.

Sept. 30-Oct. 2 — How to Develop a Long-Range DP Plan; San Francisco\*, \$385; Brandon.

Sept. 30-Oct. 2 — On-Line Information Systems; New York\*, \$425; U.S. Management Research Institute (USMRI), P.O. Box 25524, Los Angeles, Calif. 90025.

Sept. 30-Oct. 2 — Project Management Workshop; Boston\*, \$425; USMRI.

Sept. 30-Oct. 3 — Systems Workshop; Boston\*, \$425; USMRI Associates, 38 Mt. St., Hudson, Mass. 01749.

Oct. 2-3 — Performance Management of Data Base Systems; Atlanta\*, \$275; Performance Development Corp., 32 Scotch Rd., Trenton, N.J. 08628.

Oct. 2-4 — Improving Data Entry Productivity; New York\*, \$425; USMRI.

Oct. 3-4 — EDPM Orientation for Secretaries, etc.; Boston\*, \$175; USMRI.

\*Also scheduled for other cities later.

verity John O. Landers said he left the seminar with "an increased understanding of the need of communication of control methods and procedures to users in management."

"I liked the ways new techniques for estimating required skills and sizing up projects with regard to staffing them," said Gary A. Crowell, corporation teleprocessing coordinator for Weyerhaeuser Co. of Tacoma, Wash.

Speaking for a number of his classmates, Charnell commented, "I appreciated the checklist — rather than the cookbook approach to project management."

More than half of those surveyed also endorsed Brandon's workshop and case study approach to teaching standards.

"The seminar was excellent in that everybody, regardless of experience level, participated in workshops and presentations to the entire course," said Russell Griffith, systems analyst for Pacific First Federal Savings & Loan in Tacoma. "Even those with minimal experience had

to get up and act like project managers."

But there were those who didn't find the workshop format so instructive. A developmental planning analyst for the Social Security Administration, Caroline Brooks, said she found the "team and group team approach under time limits where 'the most experienced person in the

etc.' Brooks suggested the seminar served the needs of industry more adequately than it did those of government.

But while other participants noted an orientation toward business applications, they argued that the suggestion that the course was "tailored to meet the needs of industry."

"I'm involved in scientific applications, so the course required some translation," commented Charnell, "but the principles are the same."

"It's difficult to tailor a course to fit the specific needs of every participant," Armbruster said.

And Landers noted that "certainly, not all the methods described applied to our situation."

Dominick T. Salote, computer systems manager for the Florida Power Corp., summed up the attitude of many when he said, "I went to the course with the idea: here's one comprehensive management procedure. I expected to apply it on my own."

### Professional Development

group tends to take over.

"In that situation, you operate on the basis of what you know already and not what the instructor has taught you," she commented.

Some debated the kind of audience at which the course was aimed, according to the survey. Because "government agencies don't stress user interplay and the course emphasized user involvement in a proj-

# Time-sharing: \$10 per hour.

With the big, brute computer power of the DEC-system-10, the system specially

designed for time-sharing.

It's possible because there's no charge for computing time.

No "measure and resource utility," "computer resource usage," or "computer utilization unit."

Which of course make up the largest part of your time-sharing bill. And the most mysterious part of it too. Because it differs from company to company.

So we at First Data have simply eliminated computer resource unit charge.

With a time-sharing service called CLOCKWORK.

There are no "measure and resource utility," "computer resource usage," or "computer utilization unit" or any other mystical computer resource units. Just a single rate for connect or wallclock time. \$10 per hour. (Plus a small charge for mass storage and peripheral usage.)

So if you're on the system for an hour, it costs \$10—no matter

how much computing you do. Mass storage may cost as little as 1/5 of what you now pay.

What's the gimmick?

Well, there are some things you can't do with CLOCKWORK. There's no operator coverage. So you're restricted to direct computer access.

You'll have to do a little planning, too. Reserve some storage ahead of time. And plan your data file transfers to and from CLOCKWORK.

But we will guarantee you a percentage of DEC-system-10's time. So there's no danger of not getting the computing time you need.

Which means that, all in all, CLOCKWORK can do the job and save you a lot of money.

To find out exactly how and how much, just call or write our New York City office.\*

We'll give you some obligation-free answers. Fast.

Like CLOCKWORK.

Washington

\*CLOCKWORK is available only through our New York office.

## Editorials

### Share and Share Alike

Share and President Shirley Prutch are to be saluted for breaking with the closed tradition of the users group and publishing — for all of us — papers the computer measurement and evaluation (CME) project has collected over the years. Choice of the CME papers as the first of what may be many such publications is encouraging since systems tuning is an area in which many installations are interested, but one in which many more should be involved.

Having worked with authors and the companies they represent, we can appreciate, perhaps better than our readers, the effort Prutch must have put in to get the project members to share their writings with a broader audience. One of the concerns the authors had, she said, was that they would gain nothing by the release of their writings.

With that in mind, she urged users already involved in CME work to study the books — particularly Volume II, covering the more recent project work — and to provide feedback, to share their experiences and ideas with the user group.

Such two-way communication may be just what Prutch and the rest of the Share leadership need to shake loose the internal papers of other projects.

To the benefit of all of us.

### Small Step Forward

The decision by the Medical Information Bureau (MIB) to warn insurance customers that their records may go into a central information file and to provide a means of access for individuals whose files are held should be a lesson for other data bank operators.

Previously, the MIB had argued that its records only went to insurance companies and therefore those affected by the records did not need to be notified that the files were being kept.

At the same time, MIB pointed out that keeping records on persons turned down for insurance by one company was a good policy because it prevented persons not eligible for insurance from getting it, thereby keeping down the rates for all policyholders.

However, the system had no self-correcting mechanism. If an error was made in a record, there was no way for the subject of that record to discover the mistake and have it corrected.

The new notification and inspection procedures should go a long way toward correcting that problem, which should benefit everyone.

The consumer will know there is a file being kept about him and can have his doctor inspect it if he feels it contains erroneous information.

The MIB will also benefit from cleaner files, since erroneous data will be weeded out of the file over time and can therefore provide better information to the insurance companies that back it.

What is surprising is that it took so much publicity, several rounds of congressional hearings and pressure from the insurance commissioners of two states for the agency to take this first small step forward.

Other operators of computerized data banks can learn a lesson from this by adopting similar procedures before being forced into action by watchful government officials.

*'Professor, I have the feeling you've left something out...'*

### Letters to the Editor

#### Criticism of Proceedings Delay In U.S./IBM Case Unjustified

Some of the criticism in the Aug. 7 editorial regarding the conduct of the U.S. antitrust case against IBM is not justified by the facts.

The speed and gathering momentum of the case since coming under the control of Judge David Edleman is entirely understandable. A "simple" ministerial divorce case often goes a year of litigation prior to resolution. This complex economic case has mandated that the participants be educated as computer industry specialists on a world stage.

The comment that "lack of action on each side is particularly evident" is both untrue and unfair. The facts in as many as both sides and the court have been diligently working day and night for months without vacation to meet the tight trial schedule.

The observation that the government refuses to put enough manpower on the case to uphold its standards is not to be shared by IBM, most of whose motions to narrow the issues and limit discovery have been denied.

The present delay is primarily due to the necessity of bringing together all the various housekeeping legal procedures including rulings on printed documents by the Special Masters.

The court's delay is also catastrophic and will ensure that habeas does not endanger the high legal standards required in the case.

The overriding necessity for speed may be to ensure that court judgment of the fragile and precious computer empire is not overtaken by events in technology and the increasingly hostile world.

"But men may construe things after their own fashion,  
Clean from the purpose of the things themselves." — Shakespeare's Julius Caesar.

William Bayham

Hardy & Co.  
New York, N.Y.

#### Let's Manage, Not Discard, Changes

Once again the call has been made to eliminate all pain from changing computer systems. This time it was succinctly put by Robert G. Freking in the Aug. 7 letter to the editor: "Let's move from one hardware vendor to another with the ease of replacing a Chevrolet with a Ford automobile."

No matter how well it is stated, it is just not realistic. Automobiles are labor-intensive devices with relatively wide tolerances of preparation, assembly and adjustment. So are computers with occasional ABENDs. Computers are not.

A more accurate analogy is with precision manufacturing equipment. When such equipment must be replaced, there are problems of redesign, dif-

ferences in power needs, changes in operating procedures. Here the differences are identified and managed. We would do well to take the same approach.

If we try to eliminate all differences, we throw out the baby with the bath. If we concentrate instead on major changes, with all that implies, we can incorporate real improvements and provide at the same time a built-in penalty for whimsical incompatibilities.

If top management had no problems with data handling, we would have no jobs. Our calling is to eliminate all problems, but to handle them.

David L. Shuman

Anderson, Ind.

#### 'Think' is IBM's Best Product

We at Greyhound Computer Corp. believe DP decisions should be made only after careful study of all financial and equipment alternatives. Thus, we were disturbed with the quality of decision-making that went into Bechtolsheim's order of the first 370/115 from IBM (CW, July 24).

To quote Bechtolsheim's DP manager Dennis Hickey, "... when the 115 was ordered, we immediately ordered 113s, not even knowing really what the heck we were going to get."

We still believe one of the best products IBM ever produced was the slogan, "Think." If one thinks before making DP decisions such as this, then one has to consider the many alternatives to merely renting the latest IBM model.

G.B. Clarke

Senior Vice-President  
Greyhound Computer Corp.  
Phoenix, Ariz.

#### Oh Those Generalizations

I can understand the annoyance of R.F. Becker about my letter in the July 31 issue about the work of systems analysts. The article was placed under the headline, "Nonprogrammers Not Good System Designers." The headline was that of Computerworld.

My experience has led me to the conclusions stated in the letter. I would like to state again that I do not claim my experience to be valid for all systems, only those with which I have had experience.

Richard F. Mittleman  
Senior Programmer/Analyst  
William O'Neill & Co.  
Los Angeles, Calif.

*(Other letters and viewpoints on Pages 9 and 10.)*

**Computerworld** welcomes comments from its readers. Preference will be given to letters of 150 words or less. Letters should be addressed to: Editor, Computerworld, 797 Washington St., Newton, Mass. 02160.

## Highly Personal

Every couple of months a letter to the editor is followed by a "Grosch disclaimer" — most recently in connection with my Honeywell piece. I've been aboard over a year now, and I remain dedicated to the column, but I'm not sure it's for us. Seems to me it's a good time to rehash my role in this column. Our paid subscriptions approach 65,000, and surveys indicate four or five people look at each copy. That means tens of thousands of readers who don't know me from Adam, or Almanac. For me, to keep my friends, and I have to admit it's to further initiate losers of puffy programming, the Arpa network and IBM salesmanship, a few perspectives:

I'm not a journalist or an investigative reporter. I write this column as a computer pioneer, one of the last of the antediluvians. There are of course dozens of others still at work, especially in hardware design; on the user side, very early figures like Jack Belfer in the U.S. and Leslie Fox in the UK are still vigorous. But of the little game that was writing nonstored-program code and wiring plugboards in 1945, only Grace Hopper and I are really still riding the reins, still punching hard. She's an optimist; I'm a beastly, albeit reluctant, pessimist.

And I welcome the place CW gives me to stand on, because this paper is devoted to the computer user. I personally care little for industry executives, and not at all for their captive stockholders, or for the salesmen, or for the computer professionals, or for the computer users. I care deeply about the hundreds of thousands of newcomers who are caroming about in this crazy racket, trying to tell the put-ons like virtual storage from the valuable recommendations like dedicated minis.

Many times a year, in articles and speeches and casual conversation, I repeat my predictions that most mainframers will die of incompetence and greed. I believe that the last of the independent survivors will be killed off in the late 70s by the FS announcement, and that IBM will own the earth.

I don't want these things to happen! They will be bad for the user community and the professionals I worry about. I may be accelerating the process slightly by the acts of prediction and promulgation. But I see that future as inevitable unless new routes are opened, new initiatives taken. I can help more by pushing user cooperation, advocating new architecture and simpler software, throwing rocks at ICL and Honeywell, than I can by keeping quiet.

I've been pushing buttons for almost 40 years. I travel a hundred thousand miles annually to meetings and on visits. I've got friends and enemies and correspondents from Novosibirsk to Bora Bora. For me, being shamed into being a leader in the computer society. And I care — most of all, I care. Dammit, I care very much! I want computer people and their peculiar tools to be a force for good in a gravely ill society. Take me seriously!

Herb Grosch

## Will IBM (As We Know It) Survive Entry of FS?

In the days before System/370 — some five or six years ago — the planning staff of IBM started considering what would follow the NS or new systems (370) that were scheduled for announcement.

The consideration included giving the successor systems a generic name — FS. I haven't seen any official explanation of what this really stands for, but presumably it is for "future systems."

Originally these Future Systems simply had to be a convenient end-point to the financial calculations involving the expected life of the 370/15, 30, 16, 18, 165, and 168, etc., FS-1, the successor system to the 145, for instance, was targeted for announcement in December 1974, with delivery to the customer a year later.

Based upon these assumptions, IBM planners expect to keep building 145s until 1975 and to keep servicing them for their lesser customers until 1979.

Other replacement machines were targeted at other customers, and in some months after the 145 announcement, in June 1976, again with a one-year delivery time; the 135 replacement (FS-0) yet a further six months out, and so on.

At the time these items were originally entered onto calendars and into calcu-

lations, they were only of accounting interest. But now the situation is changing.

The year 1976 is now only two years up the line and user system analysts are now hearing vague rumors about the coming FS series; they're beginning to worry about being "left over" with any particular non-IBM vendor over a four- or five-year period.

If the FS series is as powerful as it is thought to be, will the independent vendor be around when the dust settles? Will it really be able to successfully compete with the great power of IBM?

### Wrong Question?

This is a good question but I think, after reviewing the situation, that it is somewhat off-base. The real question that exists here is whether IBM itself will survive the FS series — at least in a recognizable form.

(Computer corporations, together with their customer base, seem to be able to survive in some salvaged form and indeed to be useful to the customers. For example, Viatron and Memorex computer users seem to operate quite comfortably with the former IBM and GE users who are now major members of the Unicam and Honeywell families.)

This may sound like heresy, but the history of the past 15 years is certainly enough to make the question academically valid, while the events of the last 15 weeks suggest that a pretty serious possibility exists that the answer may be "no."

IBM as we now know it will not be among the survivors of the FS systems!

Historically, IBM has counted on its own customer base for its essential volumes. The 1950 success of the 1400 series in keeping the 80-column tab shops from moving to the Remington Rand 90-column. Under control of computer conversions, the first of the two customer base conversions that have so occurred.

The second (1960) success was the continued card conversion and the conversion of the still 80-column card-oriented 1400 system into the basic Models 1400 and 2000. System/3, in 1970, was probably completed the IBM punched card conversion, leaving FS with no equivalent base on which to build.

FS, therefore, poses a unique challenge to IBM.

On the financial records, as we all know, the volumes involved were so great that the IBM profit figures have always been superb by comparison with the other computer companies. But, in fact, all that happened was that each of the various computer vendors — and the large, emerging, to the then computer era customer base and that was all.

If, in 1958, someone had ranked the eight major vendors by their precomputer customer bases, then the current survivors would — with one exception — have been correctly forecast.

IBM would have been on the top with the 80-column card users, Remington second with the much smaller 90-column card market; then NCR, with its cash registers; and Burroughs, with its accounting machines, and that would have been all.

Honeywell's thermostat, RCA's television sets, and GE's washing machines, both technical capability and financial strength, lacked the essential ingredient of customers who, knowing of the aspiring computer supplier had the history of successfully coping with business data processing without computers, would be prepared to give them computer business also.

### Why Honeywell Survives

The exception is to the pattern is Honeywell. This really came about in the second 1960 era combination of the IBM punched card system and its own computer, perhaps the most dramatic clue to the dangers that may exist for IBM in the future.

In 1960 or so, Honeywell bad on its hands a technical success, the multipro-

gramming H-800 with an advanced operating system, and a financial problem because users were simply not educated to use multiprogramming or operating systems.

Honeywell then conceived the liberation approach toward the IBM punched card customer preserves. They carried this approach so effectively that, as we now know, they forced IBM into announcing ahead of time the System/360, in what is now seen to have been a dangerous but successful gamble.

IBM's approach from the early announcement — poor, delayed software, etc. — together with the six-month lead Honeywell got on System/360 — was enough to let Honeywell acquire a customer base. Effectively, then, IBM's lack of preparation for System/360 gave Honeywell a unique opportunity to entry into the mass commercial data processing field even though Honeywell did not have a convertible precomputer customer base.

In fact, Honeywell's corporate leadership took the 1963 360 unpreparedness opportunity and used it to gain not market share but leadership at the Number 2 level.

That was as good as could have been done in the situation and an equivalent opportunity may occur again for some bold IBM competition.

IBM's Future Systems are going to

bring out the whole conversion problem again because, as one of the documents puts it, IBM does not have the opportunity to build upon a preexisting base with the FS series.

So the very advantage that has previously seemed to carry it to the top may, in fact, be a serious disadvantage which certainly opens up the question as to whether it is going into as bad a gamble with the FS systems as it did with the System/360. And whether, if so, it is going to be successful.

Before this question can be intelligently resolved we need to know something more about the characteristics of the FS. These will form, then, the content of future Taylor Reports that will list some of the published characteristics so that we may make some evaluations.

## Random Notes

### Still Another R DOS Sort Created for Nova Minis

ROLLA, Mo. — Users of Data General Nova minicomputers can consider another sort facility from an independent software source. Sort for Iotec, which is written in Assembly language and runs under the real-time disk operating system (RDOS).

Sort includes user-callable subroutines to perform ascending or descending sorts on up to 40 user-specified fields. It also has a symbolic sort facility. The R DOS command line interpreter and the main sort routine. Thus, Sort can be accessed from the console keyboard or the user program to sort sequential, random or contiguous files.

Sort occupies a maximum of 4700 words of storage. It can be purchased for \$750 from Iotec at 303 E. 18th St., 65401.

### 'Strobe' Measurement Routine Modified to Report VS Data

CAMBRIDGE, Mass. — The Strobe program measurement program from Programat Corp. is now available for use under OS/VS1 and VS2.

The package produces a nine-part profile showing how a program uses computer resources. References are to user source code procedure names and files rather than to specific memory locations.

Expect to save the average VS user 10 percent. The "substantial" cost savings can be achieved by JCL and minor rewriting to avoid inefficient coding.

Strobe can be acquired for \$9,400 from the vendor at 133 Mt. Auburn St., 02138.

### Track Mapping Capabilities Included in 'Panda' Update

OAK BROOK, Ill. — OS/360-370 shops can keep better control over disk usage with version 2.2 of Panda, the cross-system Analysis/Management System from Panospheric Systems, Inc. The update adds track map capabilities to the systems volume reports.

Other changes include optional analysis of partitioned data set dead tracks, expansion of the volume summary showing more free space information, and support for IBM 3330 Model 11, 3340 and 2305 direct access devices.

Panda is available for \$1,800, or \$180/mo. for 12 months, from 1301 W. 22nd St., 60521.

### Correction

The vendor of the Data Access System (DAS) system (CW, Aug. 7) is International Computer Trading Corp., 465 California St., San Francisco, Calif. 94104.

## Two Years After Introduction

# User Still Controls VS Performance

By Don Levitt  
Or the CWS staff

PHOENIX — "Certain weaknesses in previous operating systems have been corrected [in IBM's virtual storage (VS) systems] but optimum performance is still very much under the user's control," according to the August issue of *EDP Performance Review*.

In the first of a two-part report which — intentionally or not — coincided with the second anniversary of IBM's original VS announcement, editor Philip Howard attempted to summarize the VS system's strengths and weaknesses with respect to system performance.

He covered some theoretical points but used much of the issue on those "things that programmers, systems programmers and operations personnel must be concerned with."

The writer set for a given program is the number of pages that are in use in a relatively short time. "The sum of the working sets of programs in concurrent

execution determines the total amount of real core required . . . to maintain a reasonable level of performance," he wrote.

Memory alignment "can be considered the other side of the working set coin," Howard added. If the allotment of memory is significantly smaller than a program's working set, the number of page faults will increase and performance will degrade.

"Most users have found that a ratio [of virtual to real storage] of approximately four to one is about the limit for good performance," the article said in one place, though for a noted "most users seem to have settled on a ratio of about two or three to one."

The average user will not want to get involved with the paging mechanism and, but it is important that he understand what is going on, Howard commented with reference to the replacement algorithm.

The programmer, on the other hand, must be aware of his environment. Do

## Package 'Faces' Up to Fortran Debugging, Evaluation on 1100

ATHENS, Ga. — Analyzing and debugging Fortran programs can be made easier on Univac 1100 series CPUs with the Fortran Automatic Code Evaluation System (Faces) now available from Cosmic.

Faces analyzes the source code of the program being studied and can work with simple, single module routines or with programs made up of many subroutines and functions. Extensions to the system can be made to include dynamic traces and runtime analyzers, Cosmic noted.

The system has two main parts: a front end for analyzing source code and the target program and a set of routines which evaluates the information and generates warning messages about actual or potential errors.

The front end scans and parses the Fortran source and graph structure is formed for each routine analyzed, and information is gathered about the interface between routines. Finally, the information is stored in a set of tables.

The diagnostic portion of Faces is made up of four separate routines which can be user-selected at the time of the evaluation analysis.

One of the diagnostic tests is geared to verification of correct parameter alignment between the user's routines, while another attempt to verify Common block alignments.

The other two test areas focus on analysis of variable initialization and a trace of the history and future of specified variables.

Written in Fortran V, Faces includes "approximately 7,235" card images, Cosmic said. Catalogued by the clearinghouse as program number MFS-22910, Faces is available for \$600.

Documentation costs another \$16.50, a spokesman added from the Cosmic office at 1112 Barrow Hall, here in Athens, 30601.

## Guides Outline CICS, IMS Keys

HACKENSACK, N.J. — Programmers and analysts working with CICS or IMS can avoid wading through IBM manuals — and still have detailed information at hand — with their choice of two new reference books now offered by On-Line Software International (OSI).

One of the books' unique guides applies to both the standard and new VS versions of the system it covers. The VS portion of the CICS card includes, for instance, complete macro instruction formats with optional keyword operands.

It shows the task control area (TCA) fields and how the displacement for each operand, including the Journal Control and extended Basic Mapping Support macro, TCA area, dispatch control area and the page allocation map.

A listing of all four-character transaction dump codes and their meanings is also included.

The IMS reference guide contains the definitions of system macro instruction and status codes. Rules for using the

pair to the contrary, research by a pair of IBMers in 1968 showed "the programmer must be concerned with how memory is used, rather than how much memory is used," Howard added.

"[The programmer] is no longer concerned with optimizing the total size of his program, but rather the number of pages in the working set . . . An inefficient program can simultaneously waste CPU time, core space and channel time all because of excessive paging."

Having perhaps scared the wits out of some of the more skeptical broadsheet sections of the discussion, Howard followed with a five-part checklist of what can or should be done in the areas of program design, procedural coding, data allocation and assignment, input/output and subroutine design.

According to his recommendations, he remarked that the improved memory management capabilities of VS systems have effectively eliminated many system loading and scheduling problems. However, he added, there are "a number of things" operators and system programming personnel "must keep in mind relative to overall system performance."

Selection of the proper virtual to real ratio is "primarily dependent on the type of workload."

Operators should avoid overscheduling the system, he said, and "just as with mainframe VS systems, it is still necessary to optimize the allocation of space on direct access devices."

*EDP Performance Review* is available on annual subscription for \$36, but single copies can be ordered from Howard at Applied Computer Research, Suite 298, 8600 North Central Ave., 60620.

GET, INSERT and DELETE/REPLACE calls, as well as the corresponding status codes and definitions are also included, OSI noted.

JCL for the various IMS data sets is presented along with Data Language One data base call and — again — their status codes and definitions.

Data base design macro instruction formats with options, keywords and device characteristics are shown for the various access methods.

Other categories include the general rules used in system data base physical design, segment formats, summary of pointer combinations, segment search arguments and an itemized summary of the major user and system Abend codes.

Currently, OSI is trying to distribute one reference card per installation free of charge. Add'l. charges of \$1/card will be "assessed" for each additional copy requested, OSI said.

OSI is at 411 Hackensack Ave., 07601.

## ACCOUNTING SOFTWARE SYSTEMS

### Fixed Asset Accounting - Accounts Receivable Accounts Payable - Investment Analysis

If you have an immediate requirement for one of these systems consider the fact that we can ship any or all of them on a same-day basis.

If you have a future requirement for one of these systems consider the fact that your in-house cost will average 3-4 times our cost to you.

If you have any concern about purchasing outside software consider the fact that our systems are currently in use at over 400 companies in the USA.

## DDA Goes On-Line Through IMS

HUNTSVILLE, Ala. — Large-scale commercial  
bank accounting with IMS/360-370 can handle demand  
deposit accounting (DDA) work, including on-line  
file maintenance and inquiry, report generation  
and linkage to a central information file and to the  
bank's general ledger, with a package from General  
Computer Services, Inc. (GCS).

Developed by the Bank of Alabama, the package  
enables inquiry transactions through both audio and  
video terminals. The file maintenance, run through  
the terminals, eliminates almost all keypunching of  
such items as new account data, nondollar corre-  
ctions and stop and hold orders, the vendor said.  
While maintenance work can be keyed to individual  
accounts, the package also includes a  
global edit capability for handling changes in  
a number of records. This would be especially  
useful, a spokesman suggested, when accounts  
have to be reassigned to a new account manager or  
to the control of a new branch of the bank.

The criteria for the global changes may be a  
specific item in a given field, a range of values or a  
"floor" or "ceiling" beyond which the modification  
should not be made.

The report generator feature also takes advantage

of the IMS facility for working with data fields —  
rather than whole records — by name. The re-  
moter-driven system generates either on-line or  
regular production reports, and the output can be  
displayed on a CRT, run out on a hard-copy  
printer or produced on film through a computer-  
output-microfilm (COM) unit.

The central information file is essentially a name  
and address file with indicators that point to customer  
records within individual application  
files. As currently structured, it does not even  
contain summary information about the accounts,  
GCS said.

Linkage to general ledger includes internal genera-  
tions and subsequent external to general ledger  
operations whenever an entry to the DDA operation  
requires a change in the bank's ledger.

Profit and loss analysis and account analysis  
usage reports are among the management  
outputs produced by the system, which runs easily  
within the 350K typically required for IMS usage,  
according to GCS.

The IMS DDA package is currently available for  
\$50,000 from the vendor at Huntsville Industrial  
Center, 1332 Meridian St., N.E., 35801.

## User Planning Cuts T/S Costs

NEW YORK — Users of the First Data Corp. remote computing network in this area now have a chance to cut their costs by 50% to 65% through massive rewrites, if the programs they have on the net meet certain limitations.

There is no change in the basic hardware used under the new First Data Service. Clockwork is implemented on a December 10, 1974, deadline and can work with all the major — and some minor — programming languages, as well as statistical, engineering and business application packages in the First Data library.

The user will have the flexibility of multi-  
timed job operations, including the means  
of dynamically shifting between conventional  
interactive time-sharing and remote  
batch, First Data said.

The billing is simplified, and often re-  
duced, especially under this plan because  
First Data charges a flat fee of \$10/hr plus a  
per job storage fee. No charges are made for CPU time or I/O usage, network  
spokesmen stressed.

The limitations imposed on the user to  
gain this service are "realistic limitations at  
all" for most users, First Data argued.  
The key parameter is that programs under  
Clockwork cannot exceed 24K words, or  
120K bytes, of main storage.

And programs covered by this flat rate  
scheme must be capable of running with-  
out any on-line operator support or on-  
call technical peripheral service. Output to  
tape, plotter or printer will be completed  
off-line.

Companies that will find Clockwork  
most attractive, a network source  
said, are those that can plan their  
time-sharing needs in advance.

Cost of the new service "should be very  
close to whatever current users are now  
paying, minus the CPU and I/O charges,"  
the spokesman said.

Clockwork is being managed by the  
New York office of First Data, 254 W.  
31st St., 10001.

## Truth Table Provides Order

# Nested IFs, Gaining Acceptability, Can Be Debugged

By J. Dennis Omior  
Special to Computerworld

Dating back to my days at IBM, well-informed data processing people (management and programmers) urged the avoidance of nested IFs. One of the reasons given for steering clear of these nested tool was that maintenance programmers had a difficult time reading and interpreting nested IFs.

Currently, it seems that structured programming advocates are saying that nested IFs aren't really so bad. I think most of us are going to have to start applying structured programming techniques.

So I've devised a method whereby I can debug nested IFs and I haven't seen anything comparable in any textbook or

### Concepts and Techniques

manual. My method looks strangely like a truth table; I call it an order-of-execution truth table.

The basic syntax of the IF statement remains as follows: IF condition THEN any imperative statement(s) ELSE any imperative statement(s).

To the novice, an IF is not an imperative statement, but actually it is. So the "expanded" version can look like the following:

IF  $t_1$  THEN  $t_2$ ;  $t_3$  ELSE  $t_4$ ;  $t_5$  and  $t_6$  represent conditions, and  $t_1$  and  $t_2$  represent the ability of executable instructions.

To build my table, I counted the number of IFs, which is also the number of conditions (compound conditions treated as one condition). I then took care for compound conditions, if there are  $n$  conditions, there are  $2^n$  rows in the order-of-execution truth table.

The first  $n$  columns contain all combinations of Ts and Fs, written in some orderly fashion. The next  $m$  columns contain the statements or codes for statements in the order of their execution.

Next, I numbered the IFs from left to right with a "subscript" notation.

The ELSEs should also be numbered, but not in the same manner. They are dependent upon the IFs; there can't be more ELSEs than IFs, but there can be fewer.

The ELSE "subscript" corresponds to the previous unsatisfied IF in a manner similar to pairing right parentheses with left parentheses in other Cobol statements.

In the event there are more IFs, then the corresponding ELSEs are implied at the period where the nested IF sentence ends. The previous nested IF has been properly annotated, and the table can be

illustrated as follows:

### Order Executed

$t_1$	$t_2$	1st	2nd	3rd	4th	5th
F	F	IF <sub>1</sub>	IF <sub>2</sub>	NS		
F	T	IF <sub>1</sub>	IF <sub>2</sub>	NS		
T	F	IF <sub>1</sub>	IF <sub>2</sub>	IF <sub>3</sub>	IF <sub>4</sub>	NS
T	T	IF <sub>1</sub>	IF <sub>2</sub>	IF <sub>3</sub>	IF <sub>4</sub>	IF <sub>5</sub>

Here NS means next sentence unless, of course,  $t_1$  or  $t_2$  refers to a GO TO. Each  $t_1$  and  $t_2$  represent zero or more statements.  $t_3$  through  $t_5$ ,  $t_6$ , IF<sub>1</sub> and NS are entered in the table.

The first operation executed is  $t_1$ , and can be entered in the table. After familiarization of this method, realize that IF<sub>1</sub> need not be entered; it's obviously done first. Other IFs may be eliminated, depending on the table.

Now examine the  $t_1$  column. When  $t_1$  is true, the next operations executed are  $t_1$  and  $t_2$ . When  $t_1$  is false,  $t_2$  is executed next. These can be entered in the table in the appropriate boxes.

Now we can iterate, examining each IF<sub>i</sub> column. If  $t_i$  is true, then  $t_1$  and  $t_2$  and  $t_i$ 's false  $t_i$  is executed next. Either  $t_3$  or  $t_4$  may have another IF<sub>1</sub>, which must be examined further. While we are examining, the symbols IF,  $t_1$  and  $t_2$  and NS can be entered in the table.

So far the table collapses rather quickly, particularly when there's no associated ELSE. For instance, when the first IF has no ELSE and the condition is false, processing goes to the next sentence.

Example:

IF  $t_1$  THEN  $t_1$ ;  $t_2$  ELSE  $t_3$

$t_1$	$t_2$	1st	2nd	3rd	4th	5th
F	F	IF <sub>1</sub>	IF <sub>2</sub>	NS		
F	T	IF <sub>1</sub>	IF <sub>2</sub>	NS		
T	F	IF <sub>1</sub>	IF <sub>2</sub>	IF <sub>3</sub>	IF <sub>4</sub>	NS
T	T	IF <sub>1</sub>	IF <sub>2</sub>	IF <sub>3</sub>	IF <sub>4</sub>	IF <sub>5</sub>

One can see how some of these things can be done with compound conditions (ANDs, ORs and NOTs).

I think an example with Cobol statements might fit in order.

IF<sub>1</sub> A=B MOVE ... IF<sub>2</sub> A > C ADD ... ELSE<sub>2</sub> SUBTRACT ... ELSE<sub>1</sub> WRITE ...

$t_1$	$t_2$	1st	2nd	3rd	4th	5th
F	F	IF <sub>1</sub>	WRITE	NS		
F	T	IF <sub>1</sub>	WRITE	NS		
T	F	IF <sub>1</sub>	MOVE	IF <sub>2</sub>	SUBTRACT	NS
T	T	IF <sub>1</sub>	MOVE	IF <sub>2</sub>	ADD	NS

One important thing to remember is that each time an IF is executed, the truth table portion must be interrogated to determine what is done next.

I've attempted to explain this method utilizing Cobol. However, Algol and PL/I users may use a technique similar to this since both languages permit nested IFs.

J. Dennis Omior is an instructor in computer and information sciences at the James J. Nance College of Business Administration, Cleveland State University.

## Electric Utilities Can Solve Problems with GA Minis

ANAHEIM, Calif. — Engineering computation and process control applications within the electric utility field can be managed with two software packages now available with the SPC-16 family of mini-computers from General Automation (GA).

PTAC-16 is an interactive digital computer program for simulation of transient behavior in dynamic systems and processes. PSS-2/16, developed by GA in conjunction with the Technical Institute, allows power system engineers to execute load flow analyses, dynamic simulation (stability) and short circuit studies in an interactive mode.

Each of the packages can be used as a stand-alone job under GA's DIBOS-II or as a background function under RTOS-II, the company said from 1055 S. East St., 92805.

You're in EDP and you've got an information retrieval problem. You're considering moving some routines from paper to terminals. Or maybe you're already using terminals but you've got to enlarge your system.

STOP! Those terminal ads that talk costs don't talk true costs. Hidden costs like software development, installation, computer time, and training skilled operators are being referred to as the great terminal ripoff. And EDP managers who are tired of being ripped off are switching to computer output microfilm (COM).

The best COM system on the market is the Quantor 105, which automatically develops the microfiche inside the unit. You merely mount your computer tape on the Quantor 105 and four minutes later you have your first 4" x 6" microfiche which contains

as much information as 269 pages of computer printout. After the first file, the Quantor 105 produces one file per minute.

Easy to use? Anyone can learn to operate it in less than an hour.

And the COM microfiche display not only gives your operators more information at a glance, it is so smart it stays up when the computer goes down.

Join the EDP Managers in banking, insurance, retail sales, transportation, publishing, manufacturing, and communications who have switched to Quantor COM.

If you only need to update your information on a daily basis, rip off the coupon on this page, and we'll send you a free copy of the Auerbach Report on the Quantor 105. If you like what you read, we'll show you how to save big money.

**Quantor**

## Through CRT Terminals

By Ronald A. Frank  
Of the CW Staff

ZUTPHEN, Holland — It is not unusual for a wholesale supplier to utilize a teletyping network to perform order entry and inventory control. But a supplier that decides to give its customers on-line access to selected parts of his data base is unique.

Reesink N.V. supplies everything from steel beams to farm equipment to its 20,000 Dutch customers. The firm handles about 1,500 orders each day using a network of IBM 3270 terminals installed at company offices.

Currently, customers call in their orders and a CRT operator at a Reesink site can access the price list and inventory in stock files to give the customer product information. In the late fall of 1974, Reesink will begin to allow CRT access by customers directly into the data files.

"There is some risk in this new method," acknowledged Adrienus Reesink, one of the DP directors of the company.

At the same time, he will install a 3705 front end and add 10 3275 CRTs on dial-up lines which will be used for cus-

tomers access. He is waiting for a "low-cost version" of the 3270 and in the meantime he may try the IBM 3604 banking terminal to see if it fits into his teleprocessing system.

Reesink began teleprocessing four years ago and today he maintains dual CICS systems on the 135. The major system controls the terminal operation while the backup is used with one CRT and a printer for software development.

Reesink will soon use a backup CICS system to support the 3270s when it is satisfied, he will incorporate it into his full system. The DOS/VSE system is no stranger to Reesink since the firm served a Beta test site for the operating system. The switch from DOS to the virtual version was more efficient by about 20%, he estimated.

One of the few in-house software routines is the TP restart routine which gets the system back on the air in 10 minutes.

Reesink said proudly, "He is currently

considering the operation of CICS un-

tiler access. He is waiting for a "low-cost version" of the 3270 and in the meantime he may try the IBM 3604 banking terminal to see if it fits into his teleprocessing system.

CRT operator at Reesink N.V. uses display in DP center for software development. While the operator is seated at a terminal, the CRT screen shows a software interface. The operator is wearing a headset and appears to be focused on the screen.

While the operator is seated at a terminal, the CRT screen shows a software interface. The operator is wearing a headset and appears to be focused on the screen.

The 40 3270s now operate on four-wire private lines provided by IBM for the DOS/VSE. The average round trip is a 2.40 sec. and 1.800 bits/sec. with good line reliability, he said. The turnaround time from a Reesink office in Rotterdam or S'Hertogenbosch is usually between one and two seconds, he said.

## AT&T Seeks Restrictions on Satellite Connections

By Ronald A. Frank

Of the CW Staff

WASHINGTON, D.C. — An AT&T has filed proposed regulations with the Federal Communications Commission (FCC) which would severely restrict the ability of satellite users to interconnect with terrestrial facilities provided by the phone company.

Although it cites technical problems which can arise as a result of satellite usage, the AT&T proposal is similar to the restrictions it sought to impose on the specialized common carriers last year.

Specifically, AT&T told the commission it would not allow a satellite private-line circuit to be interconnected with the telephone facilities of Western Union or automatically connect with another private-line circuit which terminates at the PBX. In the case of FX connections, interconnection would be allowed only for a limited period. The AT&T plan would also limit CCSA links to high usage trunks and would prohibit connection to the Bell dial-up network.

The domestic satellite carriers directly affected include Western Union, which recently inaugurated its Westar service, and American Satellite Corp., which is developing a service to the public.

Western Union currently has nine Westar circuits for six users in operation. In some cases, these customers are connected to telephone company lines and they would be immediately affected if the AT&T proposal, which was scheduled to take effect at the end of August, is approved.

In view of the far-reaching implications of the AT&T satellite restrictions, it is

probable that the FCC will at the very least postpone the effective date pending further consideration. Until now, the American Satellite and RCA have objected and it is believed the FCC staff will also formally object to the plan.

Part of AT&T's justification for the satellite restrictions is based on recommendations made by the CCITT, an international committee of telecommunications which has cautioned carriers against the dangers of circuits configured using two or more circuits of dual hop systems. According to AT&T, messages sent on such dual circuits will be degraded in quality because of the increased propagation delay.

Western Union disagreed with this position and said it could easily demonstrate that the use of Westar satellite circuits would not degrade the service quality provided to the customer. Western Union

took exception to the AT&T proposal concerning the technical aspects of the problem, adding the Bell had failed to raise this issue during previous domestic satellite proceedings conducted by the FCC.

Both WU and American Satellite told the commission that AT&T had decided to raise the technical questions only after domestic satellite service between American Satellite and its ability to serve users would be severely restricted if the AT&T proposal is approved by the commission.

A WU spokesman said, "The AT&T restrictions would deny users the cost-saving benefits of satellite communications, presumably at a higher cost than would be available in 1976."

Meanwhile, the FCC has ordered AT&T to interconnect with other satellite carriers on a reasonable nondiscriminatory basis.

## TP Monitor Adds Tape Support

VILLANOVA, Pa. — The University

Computer Activity of Villanova University has announced a version of its batch-oriented RMTDOS teleprocessing monitor that has tape and procedure library support.

Running in a DOS or DOS/VSE partition, RMTDOS-II provides the same facilities as IBM's HSP/RTP program, a spokesman said. The program controls transmission from IBM computers in the 360/22 to the University's 360/70 computer running under HSP, he said.

The monitor itself requires a minimum of 8K, the spokesman noted. The program is available in source form on either

cards or tape.

There is a one-time charge of \$4,000 for 10 years' use. The price for educational institutions is \$400 from the university.

## Datroute Boosts Roster

OTTAWA, Ont. — The Canadian Telephone System (TCTS) has added five Canadian cities to the Datroute network.

The addition of Saskatoon, Kingston, Sudbury, Sault Ste. Marie and Brantford, the number of cities served by the Datroute since it was introduced in April 1973 by the TCTS Computer Communications Group.

Adrienus Reesink, technical director, checks a CRT application on an IBM 3270 display.

and a descendant of the company's founder. He understands that giving certain customers direct access to price and inventory data could be valuable to a competitor, but he believes the benefits outweigh the disadvantages. The end result for the customer will be faster servicing of orders — something his competitors cannot do on-line, Reesink said.

Asked if the direct customer access could compromise other corporate portions of his company's data base, Reesink countered with an emphatic "no." The customer access will be controlled through fixed program controls formatted into each terminal. In this way an individual can be assured to access only specific information, he explained. In addition to the programming at the terminal, the central site 370/135

## DCD...the only roadmap to faster, easier program debugging and maintenance

Debugging a new program or maintaining an old program can be like finding

your way around a new city...you get lost.

DCD (Data Correlation and Documentation System) is the first and only roadmap designed especially for programmers.

It's a clean, straightforward, easy-to-follow path that guides you from input, through processing, to output, and back again.

DCD provides data flow, logic flow documentation and listings, all on a single, compact report.

You debug faster because all of the information is right in front of you.

For program maintenance, DCD is a must. It eliminates source listing searches...reduces check cycling time...and eliminates time-consuming, expensive recompiles.

If debugging and program maintenance are keeping you lost, find out more about the programmer's roadmap.

I am in a fast crewp and need to find my way around debugging and program maintenance quick. Send me more information on DCD...the programmer's roadmap. Available for OS and DOS IBM 360/370.

# Distributed Processing Network Reserves Rooms at the Inn

PHOENIX — Ramada Inns has turned to distributed processing for its 1,000-terminal nationwide hotel reservations net.

Ramada had previously used the American Express Space Bar system to handle its nationwide reservations, but when that contract was running out, "it [became] very obvious that rates were going up," said Jan Włodarcikiewicz, systems manager for Ramada Inns.

Called the Info 2001, Ramada's system currently includes about 550 Texas Instruments terminals in 100 motels throughout North America.

Each customized terminal, a TI Model 990, consist of a 4K-word processor, 960-character CRT, Facit-Addo printer, 1,200 bit/sec modem and an autodial unit.

Hotel desk clerks and managers use the terminals to inquire about room availability and to make reservations in other

company inns. The reservations are output on the terminal printer.

Launched in July, the system is now handling 30,000 to 40,000 transactions daily.

Hotel managers can notify the central computer system here to open or close their hotels for further reservations and to specify what types of rooms they have available.

The terminals themselves control the man-machine interface, Włodarcikiewicz noted. The operator calls up formats held in the system's core memory, and the processor then edits the data it is entered.

## Doesn't Really Need Terminals

The room reservations application does not really require a programmable intelligent terminal, Włodarcikiewicz noted, but Ramada wanted the capability to use the

Reservations can be confirmed instantly on Info 2001 terminal.

same terminal systems for future "property management" use in the motels, including guest billing and some accounting, he stated.

He mentioned that Ramada had considered using more than one concentrator

in its net but found that data compression in the terminals, plus the average volume and distributional qualities of the net, made one concentrator the logical choice.

Data is transmitted through the terminals' built-in Universal Data Systems modems over dial-up lines to a TI 980A concentrator in Omaha, Neb.

Also in Omaha, operators at 70 Courier Executerm 250 terminals take calls from motels without their own terminals and enter those messages into the computer system.

The concentrator sends a 4,800 bps data stream through Paradyne modems to a Digital Equipment Corp. (DEC) DC-75 front end here.

The miniframe is a dual-processor Decsystem-10 with four modules of memory, 12 disk drives and four tape stations.

Response time in the input is in the 20- to 40-second range, Włodarcikiewicz said. The length of these times is primarily due to the dial-up approach, but is acceptable with the amount of use the terminals receive, he explained.

In most areas of the country, Włodarcikiewicz stated, the terminals automatically dial up the Ramada concentrator to receive accounting messages. The system also "piggybacks" such messages onto its response when a particular motel calls up the system.

Ramada considered using dedicated lines for the terminals, Włodarcikiewicz said. Although this would have meant faster response times, it would have been much too expensive, he commented.

The terminal modems, however, can be switched to synchronous transmission over dedicated lines.

Currently there are eight incoming Wats lines to the concentrator center and three outgoing Wats lines.

Other than the reservations system, the Ramada concentrator handles corporate accounting applications and on-line program development work.

IBM, Univac, HIS and Burroughs all bid to equip the center, Włodarcikiewicz said, but DEC's price was notably lower.

Hardware for the entire Ramada system cost about \$7 million, with the terminals costing about \$4,000 each, Włodarcikiewicz concluded.

## T-Comm Supports Terminate

BOHemia, N.Y. — Periphronics Corp. has brought out a software module that allows the T-Comm 7 front-end processor to support the full range of GE's Terminate line, according to Periphronics.

The module permits communication between Terminate terminals and the front end in 7-level Ascii plus character parity.

Transmission rates on the terminal are switch-selectable between 110, 150 or 300 bps.

The T-Comm 7 front end can interface IBM 360/370s or the Burroughs 3500 series. It offers up to 93 lines in standard form.

The Terminate support module is furnished on cards with the source code included, the spokesman said. The module costs \$120/mo on a three-year lease, with delivery in two weeks from the firm at 75 Orville Drive, 11716.

# Untouched by Human Hands?

A report on Computers in Manufacturing in the September 25th issue of Computerworld.

This Special Report will look at two different aspects of computers in manufacturing: Management Information Systems and computer-managed manufacturing. We'll be covering topics like these:

- Advantages of MIS to a manufacturing firm
- The implementation of an MIS—case study of user experiences
- Trends in computer-managed manufacturing, how will it affect business side of data processing?
- Worker satisfaction and the automated factory
- Computers and "smart" production machines
- Materials Requirements Planning—what it is and what it can do

If you're involved in this area, be sure to read this report. And if you're a marketer to this field, don't miss our September 6th ad closing. For more details, see your Computerworld salesman or call Judy Millard at (617) 965-5800.

## Epoch 4: Worth its weight in gold.

When you commit your company's data to computer tape, you invest hours of costly computer time — plus valuable information.

But, most of all, you commit your company's money.

That's what makes Epoch 4 such

a solid investment.

Because it's 8000% tougher than any other tape, and 100% certified, you know your data will be there when you need it.

And, when you consider the 20-year warranty, Epoch 4 is probably

the least expensive computer tape on the market — about 6 cents a month per reel.

Epoch 4. It's as good as investing in gold. Maybe even better.

**Epoch 4: A Solid-Gold Investment.**

## GTE 'Aries' Software Helps User Choose High/Low Rate Structure

Mt. LAUREL, N.J. — Users responsible for dealing with AT&T's "bill-o'-tariff" can now access Aries and other GTE Information Systems Network design programs on the Scientific Time-Sharing Co. net.

GTE decided to make the software it has already used there to reduce its own domestic line costs, the firm said. GTE will continue to maintain the software and will provide consulting service to users.

### Effects of Change

Aries will aid the user in selecting the best high/low rate structure and will also help in evaluating the effect of the rate change on the customer's present network configuration, a GTE spokesman said.

Written in APL, Aries contains complete data files on high and low density cities, international border crossing points and

special information for government communications users.

The nationwide Scientific Time-Sharing net supports Ascii terminals from 15 char/sec and up, the spokesman said. CPU charge is \$1.10 per CPU/sec, and the connect charge is either \$24/hr or \$30/hr depending on the speed of the terminal.

### Training Fees

GTE charges \$500 for a one-day training course on Aries and the other network design software. There is a \$300 charge for each additional day, and rates for a facilities management approach are negotiable.

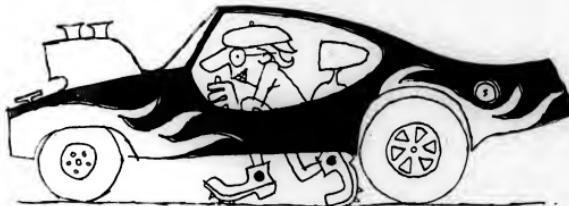

A user who does not take the training course has to pay GTE a \$50 materials charge, including updates.

Further information is available from Ron Wolfson at GTE here.

Have you increased the productivity of your machine tools with Numerical Control but overlooked the costs of manual programming? LeBlond computer assist programming can give you the other half of NC productivity. It will not only reduce your cost per tape; it will reduce errors, keep your NC machines busy making chips, and enable you to easily improve your programs to optimize machine productivity. Because customer conditions vary, we offer our computer assist programming through a variety of methods:

1. Installation on your in-house computer or at a convenient data processing center;
2. Time-sharing on the LeBlond Teletype Terminal Processing System;
3. Contract NC parts programming service; or
4. NC batch processing service.

Why not realize the full profit potential of Numerical Control, instead of just half of it? Write to the NC Systems Division, LeBlond, Cincinnati, Ohio 45208

"He also manually programs his NC machine tools."

NC SYSTEMS

## Multiplexer Brings Honors to Trio

SILVER SPRING, Md. — The National Aeronautics and Space Administration (NASA) has honored the Johnson Space Center team which has developed a multiplexer allowing transmission of burst-type and other variable speed rate data along a single channel.

The three engineers are A. George Carton, who heads the university's Applied Physics Laboratory's communication program, and Robert L. Appel and C. Thompson Pardoe, members of the space communications group.

The time-division multiplexing system was developed in response to a Goddard Space Flight Center requirement to multiplex three high-speed

averageaneous telemetry bit streams into a single bit stream.

The multiplexing is achieved by interleaving blocks of data from each source. Each block is preceded by a short, coded bit pattern specifying the source of that particular block of data.

Data blocks are transmitted as they become available from each particular source, and no synchronization of the rates is required.

The prototype system can accommodate input rates as high as 461-kbit/sec on a single input channel and output rates as high as 953 kbit/sec, according to the laboratory.

The Applied Physics Laboratory is at 20910 Georgia Ave.

## Adapter Board Links TEC Terminal

TUCSON, Ariz. — TEC, Inc. has announced printer interfaces for the com-

pany's line of Data-Screen terminals.

The hard-copy adapter boards are designed with the terminals or field-installed, the company stated.

Series 400 Data-Screen terminals require TEC's hard-copy adapter (HCA 93022) which provides RS-232C, TTL and 20mA current loop interface. It operates with all Series 400 terminals except models 430, 435, 436 and 440.

Data transfer from terminal to printer is crystal-controlled and speed ranges from 110- to 4,800 bit/sec. Data format is 11-bit ASCII or asynchronous.

Mini-Tec Data-Screen terminals can be printer interfaced with either parallel or serial hard-copy adapter printed circuit boards, which are also provided with switch-selectable interface and control options. Transfer rates from 110- to 9,600 bit/sec are switch-selectable.

The parallel adapter (HCA 98006) with TTL drivers is compatible with most printers using a ready/strobe-type interface. The serial adapter (HCA 980060) offers RS-232C, TTL or current loop interfacing, TEC stated.

The HCA 93022 adapter costs \$270, the parallel adapter HCA 98006 costs \$150 and the serial HCA 980060 adapter costs \$240. Delivery is 60 to 90 days from the firm at 9800 North Oracle Road, 85704.

## Communications Added To Merlin Turnkey Unit

MOUNTAIN VIEW, Calif. — Gruber Associates has added data communications capability to its Merlin 6000 turnkey system.

The Merlin 6000 system, primarily used for inventory control applications, includes a processor controlling up to eight hand-held terminals.

The terminals can be used interactively with the processor for data collection, and retrieval, the firm stated, and the Merlin 6000 can either produce reports on the input or collect it for asynchronous transmission over phone lines to another mainframe.

A complete Merlin 6000 with one hand-held terminal costs \$27,500, additional terminals cost \$5,000 each. The serial interface and modem cost \$3,000. Delivery is 60 days from the firm which can be reached at P.O. Box 1088, 94042.

## Omnitec Redesigns Coupler

PHOENIX — Omnitec has introduced one acoustic coupler model and revised another.

The Model 501A is designed to interface with any standard Model 33 teletype writer. The Model 701A and Model 4000 character speed capability, high sensitivity, acoustic or hardware (DAA) coupling, simultaneous TTY and RS232 output and half and full-duplex operation.

The Model 501A costs \$164 and the Model 701B costs \$341 with delivery from the firm at 2405 S. 20th St., 85034.

# SYSTEMS & PERIPHERALS

Two Univac 1106s are front ended by two 418s at the Swedish Car Registration Authority's computer center.

## Twin 418s, 1106s Coordinate Swedish Automobile Data Base

ÖREBRO, Sweden — This country recently completed the first year of operation of a centralized national vehicle registration system.

The new system incorporates not only registration data, but data pertaining to inspections, insurance, vehicle tax payments and drivers' license records in one central bureau.

Prior to the new system, vehicle registrations were administered by each of the 24 Swedish county and city card index systems. The country issued a plate number for each vehicle, and it was up to the owner to have two plates made.

The heart of the new system consists of two Univac 1106 computers each with a capacity of 131K words of main memory, front ended by two Univac 418-II computers with 16K words of memory.

These 418s facilitate handling of the heavy volume of communications flowing into the 1106.

The peripheral equipment on the combined systems includes 12 Fastrand 111 drums providing a storage facility of 2.4M characters, and two Univac 1106 disk drives and an 0782 and 1004 printer.

### Numbered for Life

Under the new system, the license plates are issued by the Swedish Car Registration Authority. The same license number stays with the car through any ownership changes — literally until the car is scrapped.

"Although efficiency of operation was the main consideration, cost studies indicated that a computer-based system would not cost any more to operate than a manual system, and would probably be more economical because of the efficiencies inherent in one large centralized system rather than several small ones," according to Stig Swanstein, chairman of the study committee of the Car Registration Authority.

The entire system is duplicated for se-

curity purposes so if one of the computers should fail, operations can proceed on the other processor. The duplication extends to the electric power which is backed up with diesel generators.

The data is transmitted by telephone lines are 240 CRTC terminals and about 400 teletypewriter terminals. The visual displays are located in county offices, while the teletypewriter terminals are situated in police stations throughout Sweden.

The initial major task for the authority was to transfer the information from

(Continued on Page 24)

## Datapoint Adds

By Vic Farmer  
Of the CW Staff

SAN ANTONIO, Texas — Datapoint has added an 11-high disk pack drive, 9-channel 1,600 bit/in. tape drive, and diskette drive to its options for the Datapoint 2200 and 3500 minicomputers.

The disk pack drive uses a standard IBM 2314-compatible pack. The firm has

structured the storage architecture along the same lines as its present cartridge disk.

The 11-high disk pack has 16 sectors per track, with each sector independently addressable by the software. This arrangement allows the user to upgrade with the only requirement being to fit the system there is more disk space available, according to the firm.

Two drives can be attached to a CPU and have a transfer access time in 35 msec with a data transfer rate of 1.5M bit/sec.

The disk is fully buffered and the buffer is fully addressable. Because of this buffering, the firm maintains that most disk operations can be carried out in the buffer itself without transferring the need data into the processor memory.

One disk and controller lease for \$672/mo.

## In Benchmark Run

# 370/155 Throughput Faster With Fabri-Tek Accelerator

By a CW Staff Writer

MINNEAPOLIS — Fabri-Tek's Accelerated System Adapter (ASA) for the IBM 370/155 is said to be 15% faster in performance equivalent to a 370/158.

IBM is currently evaluating the attachment for maintenance purposes; the ASA attaches to the IBM storage adapter, but Fabri-Tek claimed the attachment is transparent for IBM diagnostics.

The ASA, which is compatible with Fabri-Tek's Recall memory, allows a 370/155 CPU to execute instructions considerably faster than the standard 155 with IBM memory, resulting in increased throughput, Fabri-Tek said. This is because the Fabri-Tek/Data Recall memory access time is said to be over 50% faster than IBM's, with a rewrite cycle time approximately 40% faster than IBM's.

The actual benchmark tests running IMS remote terminal jobs on a 2-Mbyte 370/155, the average completion time was decreased by 20%, and the CPU active time, as measured by a hardware monitor, decreased by 23.9%, the firm claimed.

"Decreases in CPU active times of 15.8% were achieved while running batch jobs," the firm continued. The benchmark jobs were first run on the CPU without the ASA. The files were then restored and rerun after the ASA was

installed.

The CPU percent active time, a measure of CPU utilization and computer performance, is used for three weeks of operation prior to installation of the ASA. The results obtained after the ASA was installed showed an 18% decrease in CPU percent active time over a two-week period. The CPU percent active time averaged 67.4% prior to the ASA, according to Fabri-Tek.

The firm cautioned, however, that the percent improvement will vary depending on the utilization of the CPU, but the results from this installation place the improvement in the middle of what IBM claims for the 370/158.

The first feature available with Fabri-Tek's Recall memory, However, the ASA is attachable to any 155 system in combination with IBM 3360 memory, the firm said. This capability enables the 155 user to add memory with the ASA to increase his system's performance without disrupting his 3360. However, the 3360 will run at their original speed, according to Fabri-Tek.

The ASA in combination with Fabri-Tek's Recall memory model upgrades allows a full range of sizes up to 4M bytes.

The ASA is priced at \$76,000 with memory priced separately. The firm is at 5902 S. County Road 18, 55436.

## Disk, Diskette, Tape Peripherals

average latency time of 83 msec.

Software-formatted diskettes are interchangeable with IBM 374-type diskettes. The drive has a 1K-374-compatible buffer.

This buffered approach on the diskette drive, according to Datapoint, allows software previously written for a larger DataPoint disk to be used on the diskette memory with few modifications.

The diskette drive leases for \$110/mo from the firm at 9725 Datapoint Drive, 76284.

## Forms Stacker Self-Powered

NIAGARA FALLS, N.Y. — A continuous forms stacker with a capacity of 10,000 sheets of paper is now available from Moore's Detacher and Imprinter-Detacher unit which have conveyor delivery tapes.

The new unit is self-powered and attaches to the output end of the Moore's Detacher. Detacher forms are stacked in a normal position to a maximum height of 15 in. (approximately 5,000 one-part

forms). When maximum stacking height is reached, the unit stops automatically for removal of the forms.

The stacker unit accommodates forms with depths of 3.5-6 in. to 17 in., and form widths from four in. to 19 in. Single- or multiple-part fastened sets are accepted.

The stacker is priced at \$1,064 from the firm at 10001 Buffalo Ave., 14302.

## Clean all cartridges or disc packs for only \$950.

Lightweight, portable and available immediately, the System 315 handles all disc cartridges and the System 652 handles all standard disc packs. Both these non-abrasive, non-chemical, safe, efficient, and thorough, each operates independently for off-line cleaning.

Each is a proven success, and many are in use both here and abroad. Send today for this booklet which describes the System 315.

# Independent Disk Storage Adds Years to 360/65

BUFFALO, N.Y. — Textron's Bell Aerospace Division extended the usefulness of its IBM 360/65 at least two years by upgrading its disk storage with a software and plug-compatible, independent-supplied unit.

The new disk subsystem, consisting of a four-spindle Memorex 3670 disk subsystem, replaced an eight-spindle IBM 2314 disk unit.

Memorex's 3670 line is equated to IBM's 3330 disk, originally designed for the System/370.

In addition to realizing a substantially greater return on investment from its purchased 360/65, Bell Aerospace garnered:

- A 2.81 improvement in rated average access time — 75 msec down to 27 msec.
- A 2.61 faster data transfer rate — 312 kbytes/sec up to 806 kbytes/sec.
- A 71% expansion in capacity — eight spindles of 233K bytes up to four spindles of 400K bytes, at a reduced cost/btye.

#### Microcode Simulation

The interface of the 3670 subsystem to the 360/65 required the optional Memorex 2860 selector channel interface feature. A software microcode simulation, which provides 360 and 3670 compatibility by effectively changing the selector channel to operate as a block multiplexed channel, allows use

of rotational positional sensing. Rotational positional sensing allows the disk control unit and the data channel to disconnect during record search time. As a result, the CPU is free for other operations while a read/write head seeks its track address.

Software modification for the selector channel is Memorex-maintained within OS/360. Basically, this amounts to inserting Assembler code modifications within the input/output supervisor of the operating system.

Another feature, command retry, provides automatic error

recovery without interruption to the host CPU. It is generated through both the software modification and as a function of hardware, using the 2860 selector channel attachment facility.

According to Ray Carroll, Bell Aerospace Director of data processing, "Memorex's front-end microprogrammed storage control unit was a major factor in selecting Memorex."

"Microprogrammed" allows the 3670 storage control unit to receive, decode and interpret commands from Bell Aerospace's 360 by responding to the

identical set of commands used in IBM programs to operate the 3330 storage facility.

An extensive library of diagnostic microprogram routines is recorded on the read-only memory disk.

Both diagnostic and functional control programs require only 25% of the floppy disk's capacity, allowing future microprogram enhancement.

"In-line" diagnostic checking was also a important plus cited Carroll. "An individual drive may be rendered off-line to the system but on-line to the storage control unit for diagnosis

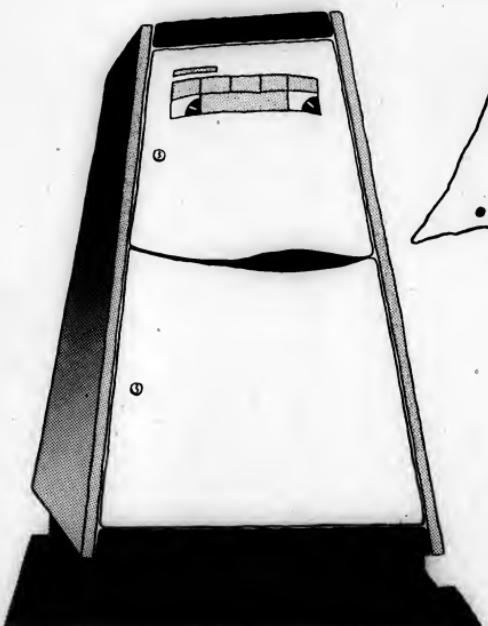

and checking without interrupting any other drives."

Other enhancements added concurrently with the disk subsystem include four rented IBM tape drives and a three-fold increase in core memory purchased from Electronic Memories and Magnetics Corp.

Carroll's operation supports Bell Aerospace's headquarters plant near Buffalo and the company's engineering and manufacturing operations in Western New York and New Mexico. Approximately 40% of applications are engineering, the rest business-oriented.

# Linguist.

(Our front ends can talk to almost anybody.)

## 'Dataway' Works Hospital Data

ST. LOUIS, Mo. — Dataway, an IBM-developed data management system for hospitals, connects to a hospital's private automatic branch exchange (PABX) telephone system to provide displays and data on a patient's bed availability, patient records, doctors present, housekeeping status and other information.

#### Interface Included

The basic Dataway consists of applications programming for a minicomputer, display consoles, junction boxes and an interface to the PABX.

For a 150-bed hospital, the price of the system ranges from \$25,000 to \$30,000.

Provided as a turnkey system, Dataway is available through Stromberg-Carlson Communications, 10151 Corporate Square, 63132.

## Increased Memory, Spooler

# Enhanced 360/30 Takes On State's Growing Work

By Patrick Ward

Of the CW Staff

JEFFERSON CITY, Mo. — A DP shop faced with a sudden jump in its workload can enhance its computer system, upgrade to a new one, or perhaps add a third shift.

A year ago, the Division of Management Systems in the Missouri State Office of Administration took the first approach.

The division had been using a 64K IBM 360/30 under DOS to do the state's payroll processing;

financial accounting, including check writing for state disbursements; a management of service work for other state agencies, according to Ted May, EDP coordinator.

But plans called for the division to add an expanded payroll/personnel system and other applications that would be beyond the scope of the division's computer, May noted.

Director Charles A. Shaffer appointed a task force consisting of the manager of computer op-

erations, a systems programmer, an information systems coordinator, a systems analyst and the programming supervisor.

The task force recommended keeping the present CPU, primarily because it was already paid for, as was a card reader, card and typewriter reader, and two 2311 disk drives and controllers.

This made enhancement more cost-effective than replacement with new hardware, May said.

The task force recommended increasing memory from 64K to

160K, going from three 2319 disk spindles to six and from two 3420 tape drives to four, May said.

### Multiprogramming

The task force favored multiprogramming in two partitions and recommended a spooler, card reader, output queue, job accounting control and reports and supplement DOS in maximizing the hardware, May noted.

Two of the system's 2311 drives would be retained to act

as spooling files for card and printer input and output.

The task force also recommended to add a second selector channel.

Computer Hardware Consultants and Services of Newtown, Pa., was chosen through competitive bidding to install 96K of add-on memory, May said.

IBM was chosen to provide the additional peripherals and the second channel.

The division looked at several spoolers, including Grasp from Software Design, Inc., Power Spooler from the Computer Corp., Spooler from Jason Data Services and Asap from Universal Software, Inc.

### Weighted Scale

Grasp came out first on a weighted scale matching the price to the division's requirements, May explained.

Some major reasons for the selection of Grasp were its complete job accounting reports, plus such features as dynamic device allocation, partition balancing, program relocatability and automatic volume sensing, May said.

Grasp runs in a partition and allows use of one card reader/punch and printer to serve both partitions, he noted.

After 10 months of operation, the enhanced mainframe's utilization, according to wall clock time, has risen 170%, with a 64% increase in monthly cost.

Current utilization is over 450 hour/mo compared with 180 hours in April 1973, May mentioned.

### What About VS?

Informal comparison runs of eight representative jobs with a 240K, 370/125 and 370/135 showed that the elapsed time for the 125 was one hour and 39 minutes versus one hour and 57 minutes for the 30.

On a cost/performance basis, the 360/30 "performed substantially better," May said.

Multiprogramming, which the added core and the spooler made possible, did not increase operator costs, May noted. Instead, it saved money, since a third shift was added and operators would have been required to handle the workload.

Compared with other hardware choices, enhancing the 360/30 meant annual savings of \$30,000 over a leased 370/125 with 128K, \$30,000 over a 370/135 with 192K and \$70,000 over a 360/40, May concluded.

### PEOPLE WHO NEED PEOPLE

#### NEED US...

If you need a programmer or want to be one, why not call or write us?

If we're not the best private data processing school in the country, then we would like to know.

# The day the Zucchini family picked up their rental van.

It might have been the programmer's fault, or maybe an imperceptible scratch on the disk surface. The fact remains, it doesn't take much to produce a computer error that really hurts.

What you need is a way to cut your possibility of error to a minimum. And the best time to start is the next time you order a disk pack. Just specify BASF.

Take our 1236, for example. It's a twelve-high disk pack that's IBM 3336 compatible. We've taken special pains to make the 1236 exceed industry standards. The point is, it's better than you really need, because there could be times when you need it. Like our special binding agent...it not only bonds the magnetic coating to the aluminum disk, it also seals the surface of the disk to prevent oxidation, so you can be sure the coating won't peel or flake off.

We've discarded conventional coating and polishing methods, and developed our own...an exclusive process that creates a surface so flat, that the possibility of a head crash being caused by uneven disks is completely eliminated.

And we use screw-in weights to insure that our disk packs are balanced for keeps.

One more point. Our 1236 costs no more than other twelve-high disks. You're already paying for BASF quality...you might as well have it. For more information on

the 1236 or other BASF disk packs or cartridges, write to  
BASF Systems,  
Crosby Drive,  
Bedford, Mass.  
01730.

## When it's BASF...you know it's

**not the disk that goofed.**

BASF

# City Agencies Capitalize on System's Expandability

CARROLLTON, Texas — For this city, processing 5,000 monthly water and sewer department bills used to be an eight-hour, five-day-a-week job using a mechanical posting machine.

Now, with only 7,000 accounts on the books, city employees complete the billing in three hours a day on a small computer, with time to spare for payroll, accounts payable, real estate tax and budgetary applications.

"We knew when our utility billings reached 7,000 accounts we would not be able to cope with the volume manually," city manager Connie Lusellen explained.

Assuming the city could not afford an in-house computer, Lusellen and his staff investigated the possibility of using a service bureau.

"The more we looked, the more we realized we wanted to keep our utility billing and accounting under our own roof," Lusellen related.

After investigating six hardware proposals, Carrollton selected a Singer System Ten.

"It was within the city's budget and offered the best features, especially ease of expanding to keep pace with Carrollton's growing population and required services," Lusellen explained.

The original computer configuration, valued at \$1,200 monthly on lease (\$45,000 purchase equivalent), consisted of:

- A CPU with 2K characters of internal memory for supervising the system and

## The Small Systems User

performing all necessary calculations.

One Model 70 terminal is a typewriter-like device used for communication between operators and computer programs and as a data entry terminal and output printer.

• One Model 42 disk drive — a high-density, direct-access data storage device.

Last April, Carrollton tested its most important selection criterion — ease of expandability.

The city's population, which expanded from 19,000 to 24,000 in one year, dictated the addition of an additional disk drive, one 150 line/min. hard-copy printer and two Model 80 display terminals.

"These additions in main memory and peripheral gear were easily made with minimal impact upon our programming," Lusellen said.

According to Lusellen, three clerks were easily trained to operate the System Ten; they now alternate work assignments at the video display terminals.

Bill processing is quick and simple, he noted. The operator needs only to key in the customer's identification number and the updated meter reading, Lusellen explained.

"The line printer automatically types out the billing date, customer name and address, inserts the previous reading and extends the charges individually for

water, sewer and garbage and then totals the bill," he said.

Each month, 125 to 150 changes or updates are added to the system including new customers, deleted customers, changes of address and posting of cash receipts for water, sewage, garbage and tax.

The processor also monitors water usage and delinquent accounts, according to Lusellen.

To run the city's 150 twice-monthly payroll checks, Lusellen simply calls up pre-filled payroll deduction tables into the main memory, via one of the terminals.

To prepare an individual check, the clerk enters the employee number and the totals of regular and overtime hours. The computer figures rates, extends amounts, makes deductions and writes the checks.

Lusellen pointed out that with the computer, the payroll checks can be prepared in two hours instead of a full day under the previous manual method.

The computer also generates the various monthly quarterly and annual government payroll reports, tax forms (W2) and statements for the Old Age Retirement System (OARS) and Texas Municipal Retirement System (TMRS).

Once a year, Carrollton's System Ten is used to issue property tax statements to the community's homeowners. On a quarterly basis, delinquent tax statements (with updated interest and penalty amounts) are produced to aid collections. Lusellen is now contemplating adding vehicle maintenance records and the tracking of outstanding warrants for the police department.

The computer's multiprocessing capability allows one operator to update the utility data base with new water customers and another operator is updating payroll records, Lusellen said.

"Without our System Ten we would have hired two additional clerks just to keep pace with our utility billing, and all our systems would be on a manual basis with no provision for handling future growth," he added.

## Job Placement Service Guides Dayton Youths

DAYTON, Ohio — Graduates, seniors and dropouts from two area high schools can check out a career, find a job, screen a college or seek financial aid with the aid of an automated guidance information system and placement service here.

Located at a career center in Number High School, a nontraditional Vocational High School, the system operates through terminals linked to a Hewlett-Packard 2000/C mini housed at the Metropolitan Dayton Educational Cooperative Association. The system was developed by Time Share Corp., according to a "Project Place" spokesman.

Supervised by a guidance counselor and the Division of Vocational Education, Ohio State Department of Education, the guidance information system provides data on careers, colleges and financial aid while the job placement system matches students to jobs available in the community, he explained.

So far this year, the project has processed applications of more than 1,000 students and has contacted 57 Dayton employers, the spokesman said. Seventy applicants have been matched with job openings in the past nine months, and another 70 have found full-time or part-time jobs through the efforts of the career office.

Because the system is updated about once a year, the spokesman suggested many students who have been able to find current information on two- and four-year colleges, scholarships, financial aid and career profiles.

In even a modest sized data entry operation, the cost of labor runs up to 80% of the total cost. So when you're looking for improved efficiency, that's the place to look.

ENTREX  
key-to-disk  
systems — large,  
medium, and  
small — incorpo-  
rate more prepro-  
grammed labor  
saving functions  
than any other  
data entry system.  
For operators and supervisors. From entry  
to output.

Automated data entry saves money just like automated anything. Typically we save our customers over 30% of their data entry costs, even in shops with as few as six keypunches.

But there's a lot more to it. ENTREX key-to-disk systems reduce training time and turnover (operators love DATA/SCOPES with their familiar keyboard and English language instructions). They give supervisors unprecedented control over all phases of validating, merging, tabulating, monitoring, and data outputs, to name only a few of the preprogrammed features. And everything proceeds simultaneously, so there's no time wasted in waiting.

All ENTREX systems are fully upwards compatible:

System 280 — New, for relatively small data

entry operations;

System 380 — The mid-range system, both in capability and number of stations;

System 480 — The most advanced data entry system with up to 32 stations;

Model 720 OCR Scanner — Scans 3000 documents an hour for only \$680 per month.

We can show you exactly how many ways ENTREX systems save money with a live demonstration at one of our 20 field offices. Call the nearest one and arrangements will be made. Meanwhile simply ask and complete systems information will be sent to you. ENTREX, Inc., Burlington, Mass. 01803

## This unique seminar on Data Communications covers things that weren't even heard of a year ago.

Data Communications isn't a complicated subject. It's a rapidly changing one. And our Data Communications seminar keeps on top of these changes like nothing else. We even provide you with free update materials for a full year after you complete the course.

Here are just some of the recent changes you'll learn about:

- Synchronous Data Line Control (SDLC) - the principles of IBM's newly announced protocol and its implications to users
- HST - Bell's newly efficient tariff for voice lines
- DDS - Bell's new all-digital data network - principles of operation and prices
- Newly approved major revisions to WATS
- Impact of Satellite Carriers and Specialized Carriers
- Value-added Carriers

### We'll cover the field

Course topics include not only these recent changes, but a series of well-selected topics that will tell you how to go about doing these data communications planning and implementation, including topics like:

- Intelligent terminals - performance and selection criteria
- Network software handlers like CICS, IMS and others
- Network organization and design - and much more

You'll also learn how to save money. This course also includes a look at money-saving techniques, using such innovative concepts as:

- Software modems
- Diagnostics for fault isolation
- Modem sharing devices and digital bridges
- Remote multiplexers/concentrators
- Front end preprocessors

### Free reference materials and continuing updates

All participants in the seminar will keep the seminar workbook—a 2-volume looseleaf outline of all course materials prepared by ICC Institute. You'll also receive a copy of "Data Modems Selection and Evaluation Guide" by Wess V. Wilips, and a "Data Communications and Teleprocessing Dictionary." PLUS you'll get free update materials for one year just to keep you ahead of tomorrow's changes.

### Dr. Dixon Doll leads Seminar

Dr. Dixon Doll, the highly respected teleprocessing consultant, leads the expert faculty at this seminar. Dr. Doll has his PhD in Systems Engineering from The University of Michigan and has been involved in the field of data communications for over 20 years. He has taught graduate level computer systems design and has served as a professional consultant to such firms as IBM, Raytheon, ICC and MCI. Dr. Doll takes an active part in the entire seminar.

### You should attend this seminar if:

- You are currently involved in data communications on a management or operational level and wish to expand your knowledge.
- Your company will be going into this field in the near future.

## Thermodynamics Comes to the Screen

PITTSBURGH, Pa. - A group of Carnegie-Mellon University scientists and graphic designers here are using computer techniques to produce a color film which depicts concepts of solution-state thermodynamics in animated form.

Supported by a two-year National Science Foundation grant of \$83,620, and by a Carnegie-Mellon University contribution of facilities time, the completed project will be used to help undergraduate students understand the principles of thermodynamics more quickly.

### Universal Laws

The thermodynamics which is the study of heat and its effect on matter and other forms of energy—is based on laws that govern man's understanding of everything from home heating and lighting to transportation, manufacturing and communications.

Students study these concepts by plotting phase diagrams to represent the changes in a given mixture that result from changes in its temperature or composition.

This will animate these changes for a dynamic effect.

To achieve the illusion of continuous movement, filmmakers will use a 16mm camera to photograph, one frame at a time, thousands of successive sets of

slightly varying schematic drawings on transparent acetate sheets traced from computer plots.

Run on a projector at full speed, the separate drawings blend together and "move."

More than 100 plots are needed for each scene, with a total of about 3,000 expected to be used in the entire film.

"The plots are definite need for visuals in this area of scientific education," said Dr. Claude H.P. Lupis, professor of metallurgy and the film's executive producer.

The cinematic explanation

should improve the rate at which students can absorb these concepts, because, according to Jairus C. Warner, research engineer in metallurgy and the film's producer-director, "the concepts are extremely dynamic. No single photo taken out of the film provides a meaningful illustration," he said.

"Our production method is also very unusual," Warner said. "I don't know of any other project of this magnitude undertaken with plots copied from computer printouts."

The plots for the film came from a computer package developed by Lupis and Warner.

## Flow Controlled at Snake River Dams

McNARY, Ore. - Three giant dams on the Snake River in Washington are generating hydroelectric power and controlling river flow conditions under the remote control of a computer.

Ice Harbor, Lower Monumental and Little Goose dams are connected by microwave to the IBM 1800 computer at McNary Dam in Oregon on the Columbia River.

### Change Reaction

Thirty sensing devices at each of the Snake River dams con-

tinually transmit information to the computer, such as height of the water, its rate of flow and the amount of power being generated. As conditions change at the dams, the 1800 automatically adjusts the equations to react to correct conditions.

Although the computer controls the dams individually, it varies the control at each depending on the conditions at the other dams, including the possibility of one dam spilling water while the other two operate at less than capacity, thus ensuring optimum conditions along the entire lower Snake River.

### Charges and Enrollment

The total cost for this two day seminar is \$350, including workbook, reference materials, year long update service, luncheons and continental breakfasts. This does not include hotel rooms, if necessary.

To enroll, look over the schedule below, fill out the coupon and send it in. Remember, enrollment must be limited, so don't wait until it's too late.

# Psychometric Modeling: A How-To for Legal Eagles

**Harold J. Spaeth**, who successfully predicted the Supreme Court ruling against the former school busing case, *Nixon v. the case of the Watergate tapes*, describes here the concept of psychometric modeling, the method used in his predictions.

By Harold J. Spaeth  
Special to Computerworld

The 1974 U.S. Supreme Court decision in the Detroit Cross-District Busing Case illustrates well the psychometric modeling technique used to predict the justices' votes and the outcome of pending Supreme Court decisions.

In the Detroit busing case, all parties to the litigation agreed that Detroit's schools were segregated. The precise question was what to do about it.

At issue here was the validity of busing Detroit school children into 52 suburban school districts and busing those from the suburban districts into Detroit's schools. It also involved the question of whether desegregation to end at the legal limits, or may surrounding suburban districts be added to achieve a more equal balance of black and white children?

If all nine justices participate in a decision, they may combine in 512 different voting alignments, ranging from 90-0-9 to 0-1-8. Only eight justices participated as in the case of the Watergate tapes, only 326 different voting patterns are possible.

The writer has analyzed better than 97% of the Court's decisions since 1958, and

## A Pretty Good Record

Harold Spaeth is a professor of political science and a member of the Computer-Dependent Data for Social Science Research at Michigan State University.

Author of a column, "The Supreme Court Computer," which appears in the *Los Angeles Herald-Examiner*, Spaeth correctly predicted the outcome of 117 of the 117 votes cast during the past two terms of the Court, anticipating the votes of individual justices with 90% accuracy.

categorized the decisions into 80 separate cumulative scales, with the content of each of these scales defined as precisely as the data permit.

The cumulative scale to which the Detroit case was assigned is desegregation. Although school desegregation is arguably an issue separate from other forms of segregation, there have been too few school desegregation cases to allow for the formation of a separate school desegregation scale.

The Court, however, did show that the Burger Court had decided 17 school desegregation cases, and not only did all 17 decisions support desegregation, so did 108 of the 117 votes cast in these cases (92%).

On the face of the most directly relevant decisions, the vote in the Detroit case should have unanimously supported cross-district busing.

Prediction, however, is not so simple. Computer-Dependent data reduction techniques – factor analysis, metric multidimensional scaling and cluster analysis – have been used in the past to find 15 scales that associate clusters together to form one of three "values" that explain approximately 85% of the Court's decisions.

The content of these three factors, or clusters, is as follows: they name the values of freedom, equality, and New Deal economics. The values, which determine segregation patterns, is equality.

By averaging the scores of each justice on each of the scales that comprise the value of equality, one finds that three of the justices are supportive of equality: Douglas, +.58; Stewart, +.54; and Marshall, +.59. Four are opposed: Rehnquist, -.65; Burger, -.54; Powell, -.51; and Blackman, -.34. Two are moderate or neutral, White and Stewart, both at +.03.

Scale scores are simply a function of the

point in a scale at which a justice begins to respond in an increasingly negative fashion to the stimulus that is assumed to motivate his voting behavior. The scores themselves may range from +1.00 (never voted against desegregation, for example) to -1.00 (never voted in favor).

Judges who support all three of the major values, as do Douglas, Brennan and Marshall, are labeled "liberal." Conversely, those who oppose freedom, equality and New Deal economics may be called "conservative." Fitting this description are the four Nixon appointees – Burger, Blackman, Powell and Rehnquist.

The two remaining justices, Stewart and White, are "moderates," neither supporting nor opposing any of the three major values.

Given the extremeness of the desegregation proposal in the Detroit case, I judged the value of equality to be more predictable of the outcome than the pat-

tern displayed in the school desegregation decisions. On this basis, Douglas, Brennan and Marshall would support cross-district busing and the four Nixon appointees would oppose it.

The outcome, then, would turn on the votes of White and Stewart. During his dozen years on the Supreme Court, White had participated in 28 school desegregation decisions. In each of them, he voted for desegregation.

Stewart, on the other hand, voted against school desegregation twice as a member of the Burger Court and once on the Warren Court.

Accordingly, White would vote with the liberal Stewart with the four Nixon conservatives.

Supporting this conclusion were two related decisions. The first was a June, 1972 decision in which the four Nixon appointees dissented from a ruling that a Virginia city could not separate itself from the county school district of which it was a part and which was under a court

order to desegregate. Speaking through the Chief Justice, the dissenters protested that the majority was squandering desegregation with racial balance.

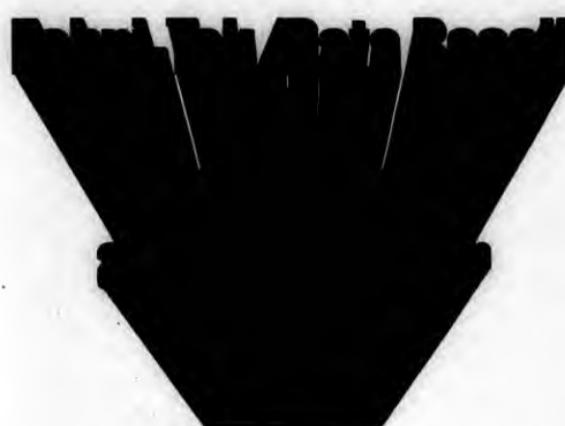

The other decision occurred in May, 1973 when the Court divided 4-4 and thereby upheld a lower court ruling that two suburban districts could not be forced to consolidate with the schools of Richmond, Va.

Although the Court does not report how the individual justices vote when they are tied, there is little doubt that Rehnquist, Burger, Blackman and Stewart opposed consolidation, with White and the three liberals supportive. Justice Powell did not participate because of former membership on both the State and Richmond school boards.

These data further supported a 5-4 decision against cross-district busing.

The Justices acted right on cue, voting 5-4, with Stewart and the Nixon appointees comprising the majority and White and the three liberals dissenting.

## GOOD NEWS FOR IBM AND UNIVAC USERS

### ANYWHERE, ANYTIME

When you need memory expansion, you get the best from Fabri-Tek/Data Recall, the leader in memory technology. And it's now easier than ever before, no matter where you are in the world. Fabri-Tek/Data Recall add-ons are marketed directly by Fabri-Tek/Data Recall or through these affiliated agents:

Computer Investors Group, worldwide  
Control Data Corporation, worldwide  
CERO, Spain  
Compania Nacional de Computacion S.A., South America  
FTI, U.K., Eastern Europe  
Orient Research, Far East  
Vanguard Data, worldwide

### WHATEVER YOU NEED

Fabri-Tek and these companies market the full line of Fabri-Tek/Data Recall add-ons for IBM and UNIVAC systems. All 360 models, and the following as well: IBM 370, models 155 and 165; IBM System/3, model 104; UNIVAC 494 and 1108. Quick delivery, installation and maintenance are available regardless of your choice of vendor. You're assured of the quality and standards of service that Fabri-Tek has been noted for whether your requirements are for memory only, memory combined with a system, or memory bundled with peripherals.

### TODAY AND TOMORROW

We've made sure that IBM and UNIVAC users will continue to get the most dependable, economical memory add-ons made. So when you need memory expansion, contact Fabri-Tek/Data Recall or one of our marketing affiliates. There's an office near you.

## If you're interested in a practical approach to the design and implementation of data base systems, we have a seminar for you.

Data Base Systems can be very effective EDP tools. But they can also be a waste of computer time and memory. The difference lies in effective planning, system selection and management. And this course will give you both the information and the basic experience you need for proper design and implementation of a data base system.

Course topics include all aspects of Data Base Management. Here are some of the subjects to be covered in this comprehensive seminar:

- The description and definition of the Data Base System Project
- The development of a full service analysis and system design
- The criteria for record design and distribution
- Optimization of data base management techniques
- The problems of data assurance and the techniques for resolving them.
- Design layout and formal implementation specifications for the data base system.
- All aspects of indexing techniques and their applications.
- All aspects of implementation for efficiency in system performance.
- All aspects of system management.
- The role of the Data Base management packages.

Workshops let you learn by doing.

Doing is the best way of learning. And before you've finished Data Base Management you'll have "done" it—complete, on-line entry/inventory management system. You'll accomplish this in four workshops, which follow instructional sessions in each segment of the course. So you'll get the information you need; that is right down and apply it. It's a technique that proves to be very effective, and it's an integral part of this seminar.

Seminar created by Leo J. Cohen and staff of Performance Development Corporation.

We selected this seminar for inclusion in the EDP Seminar Series after watching it in action. It was developed by Performance Development Corporation under the direction of its President, Leo J. Cohen, and his management consulting staff in data base systems. Mr. Cohen and his entire staff are experts in their own right. They include Alan Stein and Steve Robinson, both of whom have been leading the way in this area. All instructional staff have been involved in design and implementation of a variety of data base systems for major U.S. computer-using organizations.

### Who should attend?

If you're going to be involved in the design and implementation of a data base system—whether as a DP Manager, Data Base Administrator, planner, analyst or programmer—then you should be at this seminar. It will help your department, your company, and you!

## 'Information Utilities' Theme of Asis-74

**ATLANTA** — The American Society for Information Science (Asis) has chosen "Information Utilities" as its theme for Asis-74 to emphasize the development and use of on-demand information services required by large segments of the general public.

The development and regulation of information utilities, including regulatory policies, franchising and safeguards will be discussed, as will the impact of information utilities on the information community and society in general.

Each day of the conference, Oct. 13-17, will begin with a one-hour plenary session, also addressed to the daily theme. The technical program following will then present contributed papers, special sessions and various programs organized by the special interest groups.

Seven user workshops are being presented at Asis in conjunction with the Information Industry Association (IIA). They include Data Communications: The Future of Publishing; Educational Information Sources; Techniques for Using Micropublished Materials; On-Line Data Base Services; Filing and Business Information Techniques; The Key to Using Government Documents: How Do You Get Them?; and The Economics of Library Auto-

mation. Basis for Decisions by Library Directors.

Technical sessions will cover such topics as specialized information systems and services; information use and users' needs; semantic foundation of information science; bibliometric information systems; and information networks. Human information processing; data acquisition, consolidation and management; and information retrieval and dissemination will also be discussed.

The Science Information Service of the National Science Foundation will participate in two programs—a colloquium, "The Future of Scientific Communication—The Year 2000: Work in Progress," and a special session entitled "Toward National Coordination of Science and Technical Information: Through Research and Development."

Registration for the conference, which will be held at the Hyatt Regency Atlanta, is \$50 for Asis members, \$65 for nonmembers, and \$3 for students.

Further details are available from Asis, 1155 16th St. N.W., Washington, D.C. 20036.

## Call for Papers

**Third International Optical Computing Symposium, April 23-25, 1975, Washington, D.C.**

Original papers on all aspects of optical computing, but especially papers which emphasize the role of optical processing techniques and systems in digital computer processes are requested.

A 200-word summary of a proposed paper and biographical sketch of the author(s) should be submitted by Nov. 15 to **Third International Optical Computing Symposium, P.O. Box 639, Silver Spring, Md. 20901.**

**International Computer Symposium '75**, sponsored by ACM European Region and European Cooperation in Information, June 2-5, 1975, Antwerp/Brussels/Piura, France.

Original papers or survey articles, theoretical or practical aspects of computers and uses and its applications are solicited. Six copies of the complete texts of papers, limited to 20 double-spaced typewritten pages including an abstract, figures and references, should be submitted before Oct. 15 to Prof. E. Gelbene, c/o IRIA, B.P. 5, 78130 Le Chesnay, France.

### Schedule and Costs

We'll be offering this seminar in the following cities during the latter part of 1974. Charge for each seminar includes course materials, continental breakfasts and luncheons is \$350. Additional registrants from the same company get a reduced rate of \$300. Fees do not include hotel rooms if necessary, but we have reserved space for attendees who desire rooms. Remember, enrollment is limited!

**October 14 - 16** Boston Parker House  
**November 18 - 20** Chicago Playboy Club  
**December 9 - 11** Denver Cosmopolitan

## CI Notes

### IBM, Sperry Rand Agree To Cross License Patents

NEW YORK — Sperry Rand Corp. has entered into a nonexclusive patent cross license agreement with IBM in the area of information handling.

Information handling has been defined as "the process of specifying, defining, transmitting, receiving, retrieving, switching, sorting or displaying any form of information, intelligence or data."

The agreement covers patents issuing on applications filed prior to July 1, 1979, and does not exceed 1963 agreements involving patent rights on November 15, 1970.

In addition, IBM released Sperry and its subsidiaries — including Information Storage Systems, Inc. from liability to IBM for any infringement or alleged infringement of the IBM licensed patents.

Sperry has agreed to pay IBM \$25,000 upon execution of the agreement.

### Instrumentation Market Holds Promise for Micros

NEW YORK — Analytical instrument control is a burgeoning market for microprocessors, according to a recent study by Frost & Sullivan, Inc.

The market for analytical instrumentation in the U.S. is projected to increase by nearly 2-1/2 times from current levels to \$1.3 billion by 1982, the study stated.

The study sees the more than 100 manufacturing firms in the field turning to microcomputer-based systems for the instrumentation control and in data reduction and analysis, displacing mini-computer-based systems.

But, the report adds, minicomputer systems will continue to be used wherever five or more process instruments are to be tied together in a system's application.

### Don't Touch Your Dial...

AMONKON, N.Y. — IBM is going to court again, but this time vicariously.

IBM will sponsor the television screening of a new play entitled "Clarence Darrow," starring Henry Fonda.

The play, based on Irving Stone's "Clarence Darrow" for the Defense," will be aired Sept. 4 on NBC Television.

### Supershorts

The Graphics Systems Division of Gould, Inc. has agreed to market Beta COM systems in Japan and Australia. Canon, Inc., Tokyo, and Management Information Systems Pty. Ltd., South Melbourne, have been named distributors.

Interdata, Inc. has appointed Informatica Nacional, S.A. of Mexico City as exclusive distributor for its minicomputers there.

### As Outcome of IBM Case

## CIA Predicts Restructuring of Industry

By Edith Holmes  
Of the CW Staff

NEW YORK — In the wake of what veterans, users or investors think should happen, the computer industry is on the verge of fundamental structural change, spokesmen for the Computer Industry Association (CIA) told an audience of security analysts at a meeting here recently.

Speaking before the New York Society of Security Analysts, CIA President Dan L. McGurk and A.G.W. (Jack) Biddle, executive director for the association, said dismissal of the Justice Department's suit against IBM is unlikely, despite the filing of motions on the Street.

Following the ITT-McGraw-Hill situation, the Justice Department "has a serious image problem at the present time," Biddle remarked. "It is necessary for them to finally take a case and not cop out, not sell out, but move it ahead as quickly as possible."

Change is further inevitable because of the working level attitude of the people in the Justice Department, according to Biddle. "They're very sincere about this case... any political pressure to settle would probably result in some very major headlines."

### Bills in Congress

In the Congress, Senators John V. Tunney (D-Calif.) and Philip A. Hart (D-Mich.) have each proposed bills whose passage would affect the structure of the computer industry, he added. Tunney's bill, dealing with public exposure of computers, has been introduced. Hart's bill concerning the impact of concentration of power within any industry, have a better chance of becoming law today than they did three years ago, before ITT, Wang, and a number of other events, Biddle asserted.

Should IBM be found innocent of the charges leveled against it by the government, Biddle commented, pressure from the Hart Industrial Reorganization Act and nations attempting to protect their share of the computer industry will necessitate change (CW, July 31).

Should IBM lose the case, both CIA and the Justice Department expect the computer industry will be restructured, said Biddle.

### Shift to Restructuring

McGurk outlined the changes in the department's suit against IBM since its 1969 filing, detailing the shift in preference from regulating to restructuring the industry.

In 1969, the Justice Department asked for some specific regulatory relief for the industry: "no bundled pricing, no price discrimination, a halt to unreasonable differences in rates of return on different

equipment, and no premature product announcements," McGurk said.

But, he said, "they had changed the emphasis of their initial requests and asked primarily for a total reorganization of the computer systems business of IBM into several discrete, separate, independent and competitively balanced entities capable of competing fairly and effectively."

McGurk suggested the department changed the emphasis of its suit following the realization that its 1969 requests would probably go the route of the regulatory and injunctive provisions of its

1932 and 1952 settlements with IBM.

"In seeking a new solution, the third bite out of the apple, the department has come to the conclusion that 20 years each of the other two had lasted," he said.

McGurk reiterated the association's preference for restructuring because it would keep government intervention to a minimum, and Biddle described a plan which calls for a horizontal breakup of

Five new companies or "newcomers" would be created, each large enough to compete on an unrestricted, unregulated, nongovernmental basis.

## More UK Users Buying Packages From Independents, Study Finds

By Don Levitt  
Of the CW Staff

LONDON — The software package market in Europe will be worth in excess of \$58 million by 1980, and the United Kingdom will account for about \$13.8 million of that total, according to a recent study by IDC Europa Ltd.

Growth in the UK market has slowed in recent years, but in the face of a downward economic pressure, the market researchers found, but there has still been a steady increase in sales of package programs to UK clients from independent sources.

Department of Trade and Industry statistics quoted in the study show sales of \$7.3 million in 1973, compared with sales of \$6.5 million a year earlier. Paradoxically, although the economy has slowed the short-term growth, IDC felt the same pressures should stimulate the long-term market.

The study cited the classic reasons for going to outside sources: packages tend to be more expensive than in-house, and to the user the costs would write themselves and, by spreading development costs, they tend to be less expensive as well.

Despite this long-term optimism, software houses here are likely to have to work for their growth. They "have to prove that the software is a good investment," IDC said, but this should be a good move because "there are indications that European users are displaying increasing interest in the packages available" from UK software firms.

### Medium-Sized Users Biggest Buyers

Use of packages in the UK varies by size of installation, which is defined by equipment rental costs. "The more sophisticated users are more likely to be aware of

the advantages and availability of packages," the report found.

However, "the major area of use is among the medium-sized installations," which by IDC definition have monthly equipment rentals of \$5,000 to \$10,000. As much as 65% of these users go to outside sources for help.

Users of large business systems and minicomputer houses have not yet gone to independent sources, probably because of the still limited and scattered nature of this user base.

### 31% of IBM Users Go Outside

Looking at the UK marketplace by hardware vendor, IDC found — to no one's surprise — that IBM users are the biggest block of purchasers of packages of all kinds. This reflects IBM's dominant position in most market areas and the availability of effective IBM-compatible software.

Slightly over 31% of all IBM installations consider using outside software houses, or purchasing packages, as normal policy. This compares — in percentage of market penetration — with Unisys users (33.3% of which go "outside") and with DEC users (28.6%). The sharp lower number of these installations, however, diminishes the importance of those non-IBM figures.

According to a census included in the market study, there are, however, more IBM users than any other vendor. 15% of the IDC users go outside as a matter of marketing. "It is therefore apparent that a good deal of marketing effort is needed in this sector," the report went on.

Going further, it noted that "40% of ICL users foresee an increase in the use of packages in the future, and for many reason to believe" that the majority of users "will ultimately arrive at the conviction that the package is the best approach in many areas."

## Service Firms Finding

# Clients Want More Packages, Less Time

By Molly Upton

Of the cw staff

NEWTON, Mass. Several time-sharing firms are reporting increased business, but whether this is attributable to the general economic downturn and tight money is hard to say.

Jerry Dreyer, executive director of the Association of Data Processing Service Organizations (Adapso), observed that even in 1970 and 1971, when the recession hit, business in the services sector was good.

Service firms report business is living up to their projections. He adds, "In the last year, we've seen significant increases for the sector at a little over \$3 billion for 1974."

Firms offering remote processing are showing a higher growth rate, Dreyer said, although batch business continues strong.

Officials at both Tymshare, Inc. and National CSs, Inc. (NCSS) cited an in-

creased demand for packages that handle data management, data base establishment and modeling.

Although Tymshare's business is split fairly evenly between those who use its software exclusively and those who want raw computer time, the trend is swinging toward the packages, according to Bill Peterman, Tymshare's Washington (D.C.) district manager.

Tymshare maintains its own development staff working on long range projects in addition to a variety of commercial packages.

"Customers are finding use of our software is easier and saves front-end development work, and they like the flexibility," he said.

In the Washington area, about 80% of Tymshare's business comes from the government, Peterman said, adding that revenues have doubled since January for the region.

"We see an excellent trend continuing," he noted. "The government is shifting from buying hardware to the use of more service organizations," he said.

For Tymshare as a whole, government

business is only responsible for about 6% or 7%, he noted.

NCSS "isn't really in the raw time sale business, because there's always somebody who will sell raw time less expensively than we will," explained Bob Weissman, director of finance for NCSS, which emphasizes the services side.

"We prefer to be selling on a value-added basis than on a resource basis . . . so we continue to develop capabilities for our system that lead the customer to use our services forever," he said.

NCSS delivers a CPU which includes a time-sharing operating system to each user. It dedicates a CPU at its center to each user's needs.

"This is an alternative to the can of worms of maintaining hardware, software, personnel and a network," he said. The nature of competition changes over time in the time-sharing field, he remarked. "The customer tends to view what he's purchasing less as a commodity and more as a service, which includes network, hardware and software."

## 'One Thing Leads To Another...'

MONTVILLE, N.J. — One implication of IBM's agreement to enter the satellite business is a back door entry into the data processing market, Jerry Dreyer, executive director of the Association of Data Processing Services (Adapso).

"It's not just data communications — one thing leads to another," he explained.

Another possibility is government regulation, both in the areas of communications and data processing.

The privacy issue seems to be inviting regulation, and the fact that IBM is involved "could lead to perhaps another investigation and a reevaluation of privacy decisions in 1966," he said. The DP industry should not be regulated. This occurred as a result of an investigation into the interdependence of common carriers and data processing, he explained.

However, Dreyer said he has a positive attitude toward IBM's entry as competition for AT&T.

## NEREM SEMINARS IN BOSTON

### MINI- AND MICROCOMPUTERS SEMINAR

Seminar Chairman: A. C. Kneifer, Digital Equipment Corp.  
Hosted by: NCC, Inc.  
Meeting and Tuesday, October 24 and 25

Comprehensive Seminar of the Sheraton-Boston Hotel

9:30 a.m. Monday . . .

### S-1 DEVICE TECHNOLOGY

Chairman: W. H. Roberts, Western Digital Corp., Newport Beach, CA

LSI-16: THE WORLD'S FIRST 16-BIT MICROPROCESSOR — L. E. Fink, General Semiconductor, Inc.

A HIGH PERFORMANCE MICROPROGRAMMED 16-BIT/LSI PROCESSOR FOR B AND 16-BIT APPLICATIONS — Z. Sella and B. R. Kohn, Western Digital Corp., Newport Beach, CA

MINICOMPUTER ARCHITECTURE AND DESIGN FOR HIGH PERFORMANCE — R. L. Berrett, Material Semiconductors, Inc., Phoenix, AZ

48-K SYSTEM DESIGN CONSIDERATIONS — J. E. Cole, Western Design Center, Inc.

2:00 p.m. Monday . . .

### S-2 MAIN FRAME AND COMPUTER TECHNOLOGY

Chairman: E. D. Cossar, Hewlett-Packard Co., Cupertino, CA

THE TECHNOLOGY OF THE COMPUTER — C. G. Bell, Digital Equipment Corp., Maynard, MA

ANOTHER LOOK AT COMPUTER PERIPHERALS — R. L. Berrett, Hewlett-Packard Co., Cupertino, CA

GIVING REALTIME WITH PEOPLE: TRENDS AND PROBLEMS — J. A. Weller, Digital Equipment Corp., Maynard, MA

TRIBUS IN MINICOMPUTER SYSTEMS AND SYSTEM SOFTWARE — E. D. Cossar, Hewlett-Packard Co., Cupertino, CA

9:30 a.m. Tuesday . . .

### S-3 INDUSTRIAL APPLICATIONS

Chairman: A. T. Dewart, General Automation Inc., Andover, MA

BUILDING COMPUTER SYSTEMS — J. M. Cramer and D. M. Pfeiffer, RCA Broadcast Systems, Inc.

A PROCESS CONTROL LANGUAGE FOR MICROPROCESSORS — L. H. Anderson, Comshare, Edina, MN

PRACTICAL CONTROL APPLICATIONS FOR MICROCOMPUTERS — R. L. Berrett, Material Semiconductors, Inc., Phoenix, AZ

MULTI-TASK EXECUTIVE: AN APPROACH TO MICROPROCESSOR APPLICATION SOFTWARE — P. R. Miller, Noytronics Seminar, Inc., Santa Clara, CA

10:00 a.m. Tuesday . . .

### S-4 SCIENTIFIC APPLICATIONS

Chairman: E. Kramer, Digital Equipment Corp., Maynard, MA

LABORATORY AUTOMATION — D. Gross, Digital Equipment Corp., Maynard, MA

MINICOMPUTER APPLICATIONS IN CHEMISTRY: THE PRESENT AND FUTURE — D. E. Dix, Metcalf Chemical, Maynard, MA

THE NORTHEASTERN UNIVERSITY HIGH ENERGY PHYSICS DATA ACQUISITION SYSTEM — W. Fawley, Northeastern Univ., Boston, MA

MICRO- AND MINICOMPUTER APPLICATIONS IN BIOMEDICINE — A. Guttman, MDC, Metropolitan Lab., Denver, CO

10:00 a.m. Tuesday . . .

## CIA Heads Predict Structural Changes

(Continued on Page 29)

overnmental intervention basis, he said

Most of the users who commented on the CIA statements in a panel discussion that followed agreed that regulation would only promote stagnation."

But David R. Hathaway of G. S. Saxton expressed the view that "when he questioned how easily the industry could be restructured, 'It's just an awesome responsibility,'" he said. "I don't know what we're equipped to do."

### Vertical Reconstruction

Others doubted the wisdom of restructuring IBM along systems lines. What about vertical restructuring, "recognizing the system as a sum of components or elements?" Eugene K. Collins, director of research for Evans & Sutherland, asked the other panelists. "It seems to me that the end-user data processing marketplace is already beginning to tell us that the industry should be restructured along those lines."

Subsequent arguments indicated vertical restructuring could tend to lock in the current technology, particularly since computer systems are designed as a whole.

But the audience listened again when a third solution, one with the shareholder in mind, was proposed by Tom Franklin, legal counsel for International Data Corp. Franklin suggested a short-term, voluntary, but not necessarily immediate, reorganization between the Justice Department and IBM as a solution which would put the industry through a minimum of chaos and discontinuity.

While he agreed with Franklin on a short-term basis, Hathaway said he thought any long-term diversion or restructuring would "show the pace of technological change."

"Perhaps users would greet this with a certain sense of relief. But if you're viewing in terms of development of new applications and further lowering of your costs of computing, it may not be in their best interest to do that," he said.

While vendors and investors have stayed abreast of IBM's market position and practices because they've had to, the user has rarely been as aware of the market situation, panel members agreed. So far users have been unmoved, McGuirk said, but he expects to see attitudes even toward increasing interest as the U.S.-IBM case progresses.

Learning to live with Data Base—and enjoying it—should be high on your agenda. Every day brings new signs that the future belongs to Data Base. You can take a long stride into that future, by attending one or more of our current series of Data Base Seminars.

Our seminars have been developed, and are being presented, under the direction of Leo J. Cohen. Each of these seminars is aimed at the user of Data Base. They are designed to show the intricacies and enormous inherent power of Data Base, and to help you learn how to stand alone or more of these invaluable installations.

### WHO IS PDC?

Performance Development Corporation is one of the most rapidly growing companies in the country, concentrating the major portion of its business in Data Base. If it's Data Base, we're into it.

### LEO J. COHEN

As President and principal consultant of Data Base Seminars, which are presented over the entire country, Mr. Cohen is a widely quoted authority, speaker and authority on Data Base. He has made significant contributions to computer science—almost 20 years of experience in the field. His practical systems problems are included: performance analysis, performance simulation, S3 and S4, a number of memory management and data base compiler and sight Data Base systems.

WASHINGTON, D.C.—September 23-24, 1974  
THE DATA BASE COMMITMENT (2 days)

Defines the Data Base system, elaborates its qualities, and the role of the Data Base management package in the Data Base system. Describes the Data Base administrator, investigates the Data Base requirements and constraints for data management and emphasizes the talent levels necessary for a successful Data Base system project.

ATLANTA—October 3-4, 1974  
DATA BASE PROJECT PLANNING AND COST/BENEFIT ANALYSIS (2 days)

Describes the present and future role of the Data Base administrator, and discusses the responsibilities of the Data Base manager. Describes the Data Base management package, its function, and its cost. Describes the full range of user requirements. Presents the data splitting and package selection criteria and process. Describes the Data Base system design and constraints, and the construction of the computer system. Describes the Data Base system project design and the Data Base system administrator.

ATLANTA—October 3-4, 1974  
DATA BASE PACKAGE EVALUATION AND SELECTION (2 days)

Describes the present and future role of the Data Base administrator, and discusses the packages of building blocks buying. Establishes package selection criteria and process. Describes the Data Base system design and selection process. Reviews the PDS, DB2, S2000, and ADABAS packages. TOTAL DB2, S2000, and ADABAS are used in a formal evaluation and selection case study.

ATLANTA—October 3-4, 1974  
PERFORMANCE MANAGEMENT OF DATA BASE SYSTEMS (2 days)

Describes the performance conditions for maintaining a successful data base system. Describes the Data Base system performance measurement and analysis, and identifies the Data Base system performance. Describes the Data Base system. Devotes a systematic approach for tuning the Data Base system for maximum performance. Describes the Data Base system for tuning the Data Base system performance.

## Commerce Pushing Development Of Japanese Market With ACT '75'

By Tosi Wiseman

OF THE CW STAFF

WASHINGTON, D.C. The U.S. Department of Commerce estimates marketing potential for computer products in Japan, has organized an American Computer Technology Exhibition, ACT '75, to be held at the U.S. Trade Center in Tokyo next February.

The department stated that Japan is rapidly expanding the use of data communications within the country. And this

of "highly salable" products in Japan. In the data communications equipment category, these include large and ultralarge CPMs, large and mini terminal systems, high-speed modems and concentrators, and point-of-sale and automatic data collection systems.

In the input/output peripherals category, document scanners and OCR/Micr devices, high-speed printers, COM systems, CRT consoles with interface devices and graphics terminals and plotters have been designated as "highly salable."

The department noted that both the 1973 circuit liberalization and efforts by the domestic industry to raise its technological level prior to the announced 1975 reduction of imports and foreign investment should increase the market potential for U.S. advanced peripheral equipment.

No official statistics on imports/exports of software are available. However, Commerce stated Japan's increase both in the rate of growth and the level of technological advancement of the domestic industry should serve to substantially raise the already high market potential for software.

The Japanese government, department reported, has approved 10 licensing agreements in 1973, of which 10 were with U.S. software houses, and another 10 in 1973 of which eight were U.S.-based.

All advanced large-project software and application packages, particularly social information system software for common usage and application packages for mini- and micro-computers, are good market prospects, the department stated.

The Department of Commerce has put together a comprehensive packet listing marketing potential and guidelines for participation in ACT '75. This is available from the U.S. Department of Commerce, Domestic and International Business Administration, Bureau of International Commerce, Washington, D.C. 20230.

### 'Highly Salable'

The department has accumulated a list

## Large CPUs 'Growing' in France

LONDON — The growth rate of the installed base of computers in France varied from 7.5% for small machines to zero for medium-size equipment to 38% for large machines, according to a survey by the Commission du Traitement et de la Transmission de l'Information.

The survey, reported in *EDF/Europe Report* (EDF/ER), noted the total installed base of general-purpose computers grew by 19.5% in 1973, compared with a rate of 13.5% in 1972.

The latest survey, as of Jan. 1, 1974, included 2,852 small machines (\$10,500 to \$52,300) amounting to 26.3% of the total systems installed in France. Machines with a value between \$52,300 and \$292,800 accounted for 51.6% of the installed base, an annual growth decline of 4%. Total number of installed ma-

chines in this category is 5,596.

The number of large-scale machines (\$1.4 million to \$4.3 million) rose from 425 to 586. They account for 5.4% of the total installed base.

In terms of applications, 56.7% of the total 5,842 systems in France are used for general-purpose computing, 28.6% for management, 12.6% for manufacturing and 2.1% for scientific applications.

The Cotté survey also listed totals for various types of peripherals. Numbers include: 13,159 optical printers, 9,461 card readers, 14,331 tape drives, 552 cassettes and 12,881 exchangeable disk drives.

In addition, as of 1974, there were 12,867 unintelligent terminals and 4,152 intelligent terminals installed in France.

## Foreign Orders & Installations

Monash University, Melbourne, Australia, has installed a Burroughs B6700 for engineering work, student instruction and scientific research.

Royal Gazette, Ltd., Bermuda, has installed three Photos, Inc. Pacemaker Mark I phototypesetters.

Datascan Ltd., an Irish service bureau, has ordered a Univac 1106. The computer will be linked to Univac 9300 processors serving as remote terminals in Dublin, Cork, Galway and the UK.

GNEs, a French space organization, has ordered an OBC/ATM computer from Saab-Scania for the Ariane space project.

Ontario Hydro, a Canadian utility, has ordered a Univac 1100 for engineering

and scientific work as well as for management information.

Ulsan Institute of Technology, Korea, has ordered a Modular One computer from Computer Technology Ltd. for student programming and school administration.

Industrija Nafte, Yugoslavia, has installed a Univac 1110 and a Univac Series 60 6135 to process seismic data.

Western Electricity Board, England, has installed a Modular One computer from Computer Technology Ltd. for general applications.

Deacom, Italy, has installed a Univac 1106 for scientific and design calculations.

## Most for the lease.

# WHY NOT? ?

In 1967, when few people knew what telecommunications meant, and even fewer believed that software could be packaged, we asked 'why not?' Today, turnkey systems has begun its eighth year of supplying quality on-line software to a world-wide market. **TASK/MASTER**, our telecommunications monitor, is now installed throughout ten countries where it has proven itself to be the most popular and successful competition of CICS, IMS or any alternative approach. Another turnkey product, **KEY/MASTER**, is the industry's most advanced on-line data entry system.

turnkey systems' success has been the sole product of a small group of intelligent, aggressive, self-sufficient and unique people. If you share those characteristics and our belief in the future of on-line systems, we would like to hear from you.

## Microprocessors Prominent

# Wescon Sessions Stress Applications, State of the Art

LOS ANGELES — More than 70 hours of sessions, heavily oriented toward trends and applications of technology to marketable products and systems and toward sharing information on new and emerging technologies, are in store for Wescon '74 attendees.

All sessions will be presented in the Los Angeles Convention Center, Sept. 10-13, concurrent with the 540-booth electronics exhibition.

Four sessions on microprocessors will highlight the conference. "The Microprocessor: Parts I and II" will explore the concepts and impact of microprocessors on electronic equipment design.

Papers for these sessions include "Systems Languages: Management's Key to Controlled Software Evolution," "How to Use Your Microcomputer for All Its Worth — During Data Handling," "Micro-

### NEREM '74 SEMINARS IN BOSTON

COMPUTERS AND COMMUNICATIONS SEMINAR  
Chairman: J. Pendrake, New England Telephone Co.; Boston, MA

Wednesday and Thursday, October 30 and 31  
Communications Ballroom of the Sheraton-Boston Hotel

9:30 a.m. Wednesday  
S-9 COMPUTER CONTROL IN SUPERVISION IN COMMUNICATIONS

Chairman: R. S. Gott, IBM Corp., White Plains, NY  
A COMPUTERIZED TOLL TICKETING SYSTEM — J. R. McHugh, IBM Corp., Boca Raton, FL

STORED PROGRAM CONTROL OF A KEYBOARD BUSINESS COMMUNICATIONS SYSTEM — J. D. Wicak, Bell Northern Research, Ottawa, Ontario, Canada

ROLE OF COMPUTERS IN MOBILE DATA COMMUNICATION SYSTEMS — A. M. Gundersen, Marconi, Inc., Schenectady, NY  
INTERFACED COMPUTERIZED DIGITAL DATA SERVICECENTER APPLICATION — K. M. Jekers, Western Union International, Inc., New York, NY

2:00 p.m. Wednesday  
S-10 COMPUTERIZING THE COMMUNICATIONS INDUSTRY — A LETTER TO CERNER

Chairman: R. C. Cato, Digital Equipment Corp., Maynard, MA  
MINICOMPUTER-aidED TRAFFIC MEASUREMENT AND ANALYSIS — J. Manning, Applied Data Research, Inc., Princeton, NJ

MINICOMPUTERS IN TELEPHONE OPERATING COMPANIES: THE IMPACT ON MANAGEMENT AND ORGANIZATION — G. A. Bernheim, New England Telephone Co., Boston, MA

MINICOMPUTERS FOR MANAGEMENT: TELEPHONE SWITCHING MAINTENANCE SYSTEM — C. J. Mori, Bell Telephone Lab, Holmdel, NJ

MINICOMPUTER CONTROLLED MEASUREMENT OF VOICE BAND CIRCUIT TRANSMISSION CIRCUIT PARAMETERS — J. E. Hart, Celco Radio Co., Cedar Rapids, IA

9:30 a.m. Thursday  
S-11 NEW COMMUNICATIONS SERVICES

Chairman: R. A. Fickett Communications Inc., Waltham, MA  
DATAPHONE DIGITAL SERVICE — C. F. Stroh, AT&T Co., New York, NY

DATA/TRANSMISSION SWITCHED DIGITAL NETWORK — E. V. Farnham, Data Transmission Co., Vienna, VA

PACKET-SWITCHED DATA COMMUNICATIONS SERVICES — L. T. Tamm, Bell Telephone Laboratories Inc., Holmdel, NJ

PANEL DISCUSSION

2:00 p.m. Thursday  
S-12 PRACTICAL ASPECTS OF COMPUTER COMMUNICATIONS SYSTEMS

Chairman: S. M. Isaacs, State Street Corp. and Trust Co., Boston, MA

REAL TIME AND BATCH TRANSMISSION SYSTEMS: WHAT MANAGEMENT ARE THEY REALLY OFFICING? — J. H. Duman, Management Sciences, Inc., New York, NY

SWITCHING, PATCHING, MONITORING AND TESTING AT THE EX-DATATEL INTERFACE — B. S. Sage A. Lucero and R. A. D'Antonio, International Telephone and Telegraph, Providence, RI

WHERE TO USE PABX IN DATA NETWORKS — M. F. Reutter, A. D. Litt, R.C. Cambridge, MA

THE COST OF SECURITY IN COMPUTER COMMUNICATIONS SYSTEMS — J. C. Ladd, Bell Telephone Co., Boston, MA

REGISTRATIONS RECD'G BY OCT. 15TH  
IEEE Members \$30 Non-Members \$99

REGISTRATIONS RECD'G AFTER OCT. 15TH  
IEEE Members \$95 Non-Members \$125

## Standing-Room-Only on Exhibit Floor

LOS ANGELES — All display and demonstration space for Wescon '74 has long been spoken for by some 350 companies, with 25 more on a waiting list, show managers reported.

A special section of the exhibit hall has been set aside for booths representing the communications industries. Almost 30 companies will be exhibiting their equipment in this area.

Other parts of the exhibit floor will be devoted to components and microelectronics, instruments and instrumentation, and production and packaging.

The computer segment will be aimed

primarily at electronics engineers, with computer-aided design, time-sharing and special-purpose systems comprising the main part of the exhibit. The show organizers admitted they expected to see more peripherals than mini's on exhibit, but added that companies will be exhibiting in the computer section, would booths have computer equipment in their booths.

A partial list of exhibitors includes Burroughs, Data General, Digital Equipment, Digital Electronics, Computer Components Associates, Macradata, Systech/Tel-Sys, Teradyne and Texas Instruments.

processors: A Component for All Seasons" and "Distributed Data Acquisition with Microprocessors."

A survey session entitled "Microprocessor Market — Design, Applications" will provide an overview for attendees. The four papers to be presented are "The Microprocessor Market — Now and Future," "Building Low-Cost Systems With Microprocessor Hardware," "Microprocessor Design — Use the Software, Too," and "How to Design a Microprocessor for Your Application."

A follow-on survey session, "Microprocessor — The 2nd Generation," will present several new and available systems. These include Fairchild Semiconductor's F8 microprocessor, Intel Corp.'s microcontroller family, Motorola Semiconductor's MC6800, and National Semiconductor's F800, Fairchild Solid State's COS/MOS microprocessor, Rockwell Microelectronics' eight-bit parallel processing system and Signetics Corp.'s 2650 eight-bit processor.

"Quo Vadis Electronics" is the title of a mini-symposium on the future. Papers include "The Future of Electronics," "Electronics and the Quality of Life," "The Corporation's Measurement of Success" and "The Role of Telecommunications and Computers in Facilitating Technological Changes."

"Dataphone Digital System (DDS)," "Canadian National's Dataroute System," "International Digital Data Service" and "The User's Current Needs" are the papers around which an application session on "The Real World of Digital Communications" will center.

A survey session on charge-coupled devices (CCD) and an application session on advances in CCD technology will offer much information on "Current Processes and Applications for CCDs," "CCD Image Sensors," "CCDs as Drum and Disk Encoders" and "CCD Memory Concepts."

Other sessions of interest will discuss LSI testing and emerging display technologies.

Additional selected papers with application to the computer industry include "Application of Computers to the Dairy Industry" and "Reliability of Ceramic and Plastic Encapsulated IC's in a Computer Environment."

A technical session will deal with the question of "What to Do If the Lights Go Out — The Uninterruptible Power Story." Papers for this session include "Designing Protection Against Brownouts and Blackouts Into a Large Computer System," "Protecting Semiconductor Memory Against Power Variation of Interruption" and "Uninterruptible Power — Through the Eyes of a Power Supply Manufacturer."

## Contracts

Wanzco, Inc. has received a contract, valued in excess of \$1.1 million, from Datsyn International for Mod 7 digital tape drives and formatters which will be used in conjunction with the Datsyn 100 Source Data Operating System (SDOS).

American Management Systems, Inc. has been awarded a contract by the American Institute of Biological Sciences to provide computer services in support of the membership and subscription programs of the Institute and five affiliated societies.

Branson Applied Systems, Inc. has received a contract from the U.S. Department of Transportation's National Highway Safety Administration to design an on-line management information system for traffic safety programs.

Scientific Systems Services has been awarded a contract by Florida Power & Light for the development of a nuclear reactor computer program.

TRW Data Systems has received a contract from Allied Stores Corp. to supply TRW 4000 data hardware and software to expand credit authorization to three additional divisions.

Information International, Inc. has been awarded a \$165,000 contract from the State of California to design software that will enable the installed Videocomp 800 photo composition system to operate on-line to the Stephen P. Teale Data Center's 370/168.

Computer Congregations Corp. has received a five-year contract from Metro National Bank of Denver, Colo., for a complete on-line central information file system.

Information Displays, Inc. has been awarded a contract from ITT Electrophysics for a special Edigraf with 16 levels of intensity.

## Government Paper Indicates

# TP Industry Control Concerns Canada

By T.M. Whiteman

Special to Computerworld

TORONTO, Ont. — Canadians are apparently becoming concerned about a dilution of their control over the domestic telecommunications industry.

In a working paper of the Department of Communications dealing with the relationships of the Canadian telecommunications carriers and their equipment suppliers, it was suggested that a dilution of Canadian control in the manufacturing sector and a reduction in research and development activity would cause hardware requirements of the Canadian carriers to be subordinate to the design and development dictates of larger and more influential markets.

"Once control manufacturing, development costs and the rate of innovation are lost to Canada, the economic consequences will prevent the realization of the full role of telecommunications in the areas of trade, commerce, cultural enrichment and entertainment," the paper stated.

The working paper was produced at a basic level to encourage discussions between suppliers, the manufacturers and the various government agencies concerned.

For perspective, it is important to consider that the 23-member Canadian Telephone and Telegraph Carriers Association (CTCA) accounts for more than 99% of the Canadian telephone and telegraph service. Annual total purchases by the carriers for telecommunications equipment amounted to \$1 billion in 1973 and is expected to reach \$2 billion by 1980. The equipment needs of the carriers are supplied by about 235 companies.

"A domestic manufacturing industry with a Canadian-based R&D capability is necessary to ensure low-cost telecommunications in Canada," the paper stated.

"The decline of a strong Canadian presence in telecommunications research and development, manufacturing and distribution would be a serious effort on the part of the carriers," the paper noted. "Equipment costs would increase and many other hidden costs associated with compatibility, standardization, docu-

mentation, training and premature obsolescence would add to the burden."

The inevitable consequence of carrier dependence on outside technology would result in higher prices and lower grades of service to Canadians, the paper argued.

"Canada's telecommunications carriers have been well served by the vertically integrated manufacturing industry and other specialists," the paper said.

"Captive markets and North American equipment standards have prevented excessive competition, and in consequence the supply industry is less fragmented than most other manufacturing sectors."

"Unrestricted competition in telecommunications manufacturing would weaken this predominantly Canadian industry," the paper argued, "resulting eventually in higher equipment prices and costs." The fragmented industry cannot perform as efficiently as a lesser number of large integrated organizations.

The government's working paper pointed out that action taken in the U.S. to weaken the vertical integration structure, including restriction of the manufacturing arm to certain markets, are not appropriate to Canada,

where research and development, manufacturing and carrier operations are on a much smaller scale.

"All developed countries have strong manufacturing capability in telecommunications equipment and have taken special measures to support the manufacturing sectors," the report stated.

"Most telephone systems are owned and operated by the government and the public sector is used to support a limited number of domestic manufacturers. As a consequence, trading in telecommunications equipment between developed countries is limited to a few highly specialized items."

The paper noted that the Canadian market for telecommunications equipment cannot support a large number of manufacturers and suggested a rational distribution of manufacturing activity, without encouraging the establishment of new foreign suppliers, which would eventually result in loss of ownership and control.

The government pointed out that the working paper does not necessarily mean that it has an intention to change its present structure to meet its own needs. It is intended chiefly to provide a basis for discussion.

## Orders & Installations

The University of Minnesota has ordered a Recot Model 100 information storage and retrieval system from Dynamic Information Systems, Inc. to provide multiplesystem fast access to the university's central addressing file.

Fairfax County (Va.) Public Schools System has ordered two HP-2000F systems and an HP-3000 system from Hewlett-Packard to implement a county-wide interactive time-sharing computer network.

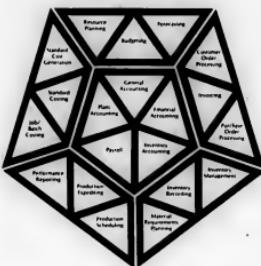

Westinghouse Air Brake Co. has ordered a Univac 90/70 for manufacturing, inventory control and other applications at its data center.

Affiliated Bankshares of Colorado, Inc. has installed a VSC-8000 data collection and retrieval system, incorporating a voice response unit with data communications capabilities, from Applied Information Industries.

Kroger supermarket chain has ordered 337 Store 2100 field data entry terminals from MSI Data Corp.

Singer Simulation Products, a division of the Singer Co., has purchased three Systems 85 real-time systems from System Dynamics Laboratories, Inc. The systems will be used in power plant training simulators Singer is providing the Tennessee Valley Authority (TVA).

**You don't have to design your own application system to get one that fits.**

Martin Marietta Modular Application Systems are custom-built in performance, but not in price.

There are six basic applications: inventory; cost and manufacturing control; order processing; financial accounting; and business planning.

And they've been tested and refined by more than 400 implementations. For more information, write: Mike King, Martin Marietta Data Systems, National Sales Office, 401 Washington Avenue, Towson, Maryland 21204.

## Industry Heads Convene Gold Futures Trading May Be Imminent

Civ West Coast Bureau  
EL SEGUNDO, Calif. — More than 100 representatives of computer and electronics firms met here recently to discuss the possibility of trading in gold futures.

An official of Xerox Corp., the seminar's host, said his firm is already considering trading in gold futures to protect itself from the fluctuations in the

price of gold. A.J. Gormley, group manager, procurement, said Xerox might consider a bilateral agreement with some of its suppliers to help share the margin cost of trading in gold futures.

The meeting was called to find a method of stabilizing the prices firms have to pay for components that contain gold.

Attendees at the seminar included Burroughs, GTE Sylvania, Hughes Aircraft, Lockheed Electronics, TRW, Control Data, Comshare, Electronic Memories & Magnetics, Memorex and Data Products.

It was estimated that firms represented at the meeting use \$15 million worth of gold monthly.

The issue of hedging on gold price movements were discussed by Dr. Henry G. Jarecki, an associate professor of psychiatry at Yale Medical School.

He used computers in his own design and, with them, began to "gold" trading, subsequently becoming chairman of the board of Mocatta Metal Corp., one of the largest gold bullion dealers in the U.S.

The gold futures were described by Jarecki as a means of stabilizing manufacturing costs

and eliminating risks.

By swapping gold futures for spot gold, the futures contracts act as an insurance policy, offering protection against whiplashes that occur in the market, he said.

Futures also can be used in conjunction with scrap gold, protecting the price of the scrap while it is being reprocessed for use or sale, Jarecki said.

The crucial question, he continued, is whether the U.S. Treasury will sell gold from its supplies to meet demands.

If they do not sell, the balance of payments of the U.S. could suffer badly and the price of gold go to \$200 or \$250 an ounce.

Gormley said Xerox will probably continue to employ its use of gold futures as a way of stabilizing prices over a period of one year.

Xerox has a license to trade in gold futures, he said, and added "We're considering it."

He said that in the future, he said, is also a possibility because of the fluctuations in the price of the metal.

**Get Model 20  
language out of your  
system.**

Dearborn DPS/DOS™ software has converted over 2,000 users from Model 20 language into a DOS system. And, with a record of totally automatic conversions over 99 percent.

That means that you

realize the advantages of

DOS sooner.

Less downtime and overwork for programmers. Less upset.

For fast relief, call your nearest Dearborn office now.

**With Second-Quarter Results**

**Inforex Figures Move Into Plus Column**

BURLINGTON, Mass. — Inforex's second-quarter results occupy the earnings column in a new chart showing the income of the two preceding quarters.

Earnings totaled \$30,000 or 1 cent a share compared with \$90,000 or 33 cents a share in the year-ago period.

Revenues were 29% above those of the same 1973 quarter, reaching \$11.7 million compared with \$9.1 million last year.

Revenues included \$5.2 million from rents and service, compared with \$3.9 million in the year-ago period.

Distributor sales and long-term leases more than offset the absence of third-party sales, the firm said. Compared with the second quarter of 1973, shipments to distributors had increased over 50%, noted Timothy C. Cronin, Inforex's chairman.

Distributors have purchased over 500 Inforex systems since 1970, he added.

For the six months, losses totaled \$62,000 or 2 cents a share compared with earnings of \$1.7 million or 65 cents a share last year.

Revenues for the half year rose to \$22.5 million from \$16.9 million in the 1973 period.

Cronin said that "a relatively small shift in the sales mix of systems can cause a disproportionate swing in net income in a particular period."

"Additionally, the anticipated

gains in revenues later in the year will be offset somewhat by new product introduction expenses."

The slip in gross profits as a percentage of revenues from the year-ago quarter "largely reflects the inflationary pressures in labor and materials which have been experienced," Cronin said.

The effects of price hikes and other measures will not become significant until next year, he added.

**AMX Takes Third-Quarter Loss**

SUNNYVALE, Calif. — Third-quarter losses dragged down AMX's revenues and earnings in its hefty six-month earnings of \$244,800 to \$30,000 or 2 cents a share for the nine months.

However, the loss of \$214,600 or 17 cents a share in the quarter was considerably less than the year-ago loss of \$1.1 million.

The \$30,200 earnings in the

nine months represents a turnaround from the loss of \$25,500 or 20 cents a share in the 1973 period.

Revenues for both periods increased: to \$8.41 million from \$8.38 million in the 1973 quarter, and to \$24.9 million from \$22.5 million in the year-ago period for the nine months.

"Sales and profit during the quarter were affected by the transition in production from earlier add-on 'memory systems' to the systems version of the IBM Models 370/135 and 370/158, and the Processor Speed Up addition for the Model 155," explained President Orion L. Hoch.

"The cost of initiating their manufacture, and the fact that we are at the high end of the 'learning curve' on these new systems, hurt profits," he noted. "In addition," Hoch said, "semiconductor component production costs, which represent a significant proportion of total memory system costs, did not decline as rapidly as they should."

**Centronics Year-End Results Show**

**Sharply Higher Earnings, Revenues**

HUDSON, N.H. — As soon as Centronics Data Computer Corp. closed its books on 1974, in addition to record earnings and higher earnings and revenues, President Robert Howard forecast a 50% jump in earnings for next year.

Earnings for 1974 totaled \$7.95 million or \$1.65 a share compared with \$4.9 million or \$1.01 in 1973. Revenues rose 72% to \$41.5 million from \$24 million.

Fourth-quarter revenues reached \$12.2 million compared with \$8.2 million last year, while earnings per share rose to 47 cents a share compared with \$1.7 million or 36 cents a share.

Howard based his forecast for 1975 on a number of factors: anticipated benefits from ex-

panded product lines, commitments and estimates of increased purchases by present customers, an anticipated customer base and a large proportion of new production now going to major computer mainframe producers, who more precisely schedule their long-term requirements for our printer products," he said.

Howard noted this trend began the first quarter of 1975 because of a planned revamping of production facilities and methods.

**Acquisitions**

Datatab Systems, Inc. has acquired the Systems Division of Facit-Addo, Inc. and will market Facit-Addo systems in the U.S.

Remote Computing Corp. has acquired Merlin Systems Corp. through an exchange of stock.

Management Computer Services, Inc. has acquired the client accounts and programs of Educators Processing, Inc. Terms of the purchase were not disclosed.

University Computing Corp. (UCC) has acquired Hydrick Mapping Co. to broaden UCC's map coverage for the energy exploration and production industry.

Varian Associates has completed the acquisition of Communications Transistor Corp. (CTC) for \$6.6 million in cash. The transaction modifies a 1969

agreement under which Varian provided funding for the start-up of CTC. The original agreement called for the exchange of Varian stock in exchange for the remaining CTC shares.

Two Canadian firms, Corporation House Ltd. and Fisher & Wexler Ltd., have merged their consulting practices under the name of Corporation House Ltd.

TRW, Inc. has acquired Financial Data Services, Inc.

Boeing Computer Services, Inc. has acquired Androcor Industries, Inc., point-of-sale terminal service company. Terms of the acquisition were not revealed.

Itel Corp. has acquired Data Processing Systems, Inc., Inc., for an undisclosed purchase price. Itel has also acquired Alpha Omega Computer Systems, Inc.

# THE BEST COMPETITOR THE 2314 NEVER HAD.

For every EDP manager who still needs 2314-type equipment, the Memorex 3660 is a better choice in disc storage systems.

The 3660 is fully compatible with the 2314, yet its performance surpasses that of the 2314 file system in every way. And it has the superior reliability and maintainability of Memorex head and drive technology. It is the *independent* system that has set the pace in throughput and economy since 1969.

More than 10,000 3660 drives are in operation, worldwide. The 3660 has logged more than 90,000,000 system operating hours on IBM 360/370 and other computers that use 2314-type storage systems.

And we offer responsive delivery, flexible terms and the backing of Memorex's international field engineering organization—the largest and most experienced of the independent storage system service groups. We have 124 Memorex sales and service offices throughout the world.

So there never was a better time to get a 3660, the best competitor the 2314 has ever had. Whether you need more 3660 capacity or whether you need the advantages of switching to an independent system, call your nearby Memorex representative.

Memorex Corporation, San Tomas  
at Central Expressway,  
Santa Clara, California  
95052, and all major cities.
